If you find information in this manual that is incorrect, misleading, or incomplete, we would appreciate your comments and suggestions.

FCC Warning

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the Instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

CE Mark Warning

This device is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

Energy Saving Note of the Device

This power required device does not support Standby mode operation. For energy saving, please remove the power cable to disconnect the device from the power circuit. In view of saving the energy and reducing the unnecessary power consumption, it is strongly suggested to remove the power connection for the device if this device is not intended to be active.

WEEE Warning

To avoid the potential effects on the environment and human health as a result of the presence of hazardous substances in electrical and electronic equipment, end users of electrical and electronic equipment should understand the meaning of the crossed-out wheeled bin symbol. Do not dispose of WEEE as unsorted municipal waste and have to collect such WEEE separately.

Revision

PLANET IGS-801M User's Manual

MODEL: IGS-801M

REVISION: 2.0 (July, 2021)

Part No: EM-IGS-801M_v2.2

1. INTRODUCTION

1.1 Packet Contents

Thank you for purchasing PLANET Industrial Layer 2/4 Managed Ethernet Switch, IGS-801M. “**Industrial Managed Switch**” mentioned in this user’s manual refers to the IGS-801M.

IGS-801M Industrial 8-Port 10/100/1000T Managed Ethernet Switch

Open the box of the **Industrial Managed Switch** and carefully unpack it. The box should contain the following items:

| Industrial Gigabit Ethernet Switch x 1 | Quick Installation Guide x 1 | Wall-mount Kit x 1 |
|---|---|---|
|  |  |  |
| DIN-rail Kit x 1 | RJ45 Dust Caps x 8 | |
|  |  | |

If any item is found missing or damaged, please contact your local reseller for replacement.

1.2 Product Features

- ▶ **Physical Port**
 - 8-Port 10/100/1000BASE-T RJ45 copper
- ▶ **Industrial Case and Installation**
 - IP30 aluminum case
 - DIN-rail or wall-mount design
 - Redundant power design
 - 12 to 48V DC, redundant power with reverse polarity protection
 - AC 24V power adapter acceptable
 - Supports EFT 6000VDC protection for power line
 - Supports 6000VDC Ethernet ESD protection
 - -40 to 75 degrees C operating temperature
- ▶ **Layer 2 Features**
 - Prevents packet loss with back pressure (half-duplex) and IEEE 802.3x pause frame flow control (full-duplex)
 - High performance Store and Forward architecture, broadcast storm control, runt/CRC filtering eliminates erroneous packets to optimize the network bandwidth
 - Supports **VLAN**
 - IEEE 802.1Q tagged VLAN
 - Provider Bridging (VLAN Q-in-Q) support (IEEE 802.1ad)
 - Protocol VLAN
 - Voice VLAN
 - Private VLAN
 - Management VLAN
 - GVRP
 - Supports **Spanning Tree Protocol**
 - STP (Spanning Tree Protocol)
 - RSTP (Rapid Spanning Tree Protocol)
 - MSTP (Multiple Spanning Tree Protocol)
 - STP BPDU Guard, BPDU filtering and BPDU forwarding
 - Supports **Link Aggregation**
 - IEEE 802.3ad Link Aggregation Control Protocol (LACP)
 - Cisco ether-channel (static trunk)
 - Provides port mirror (many-to-1)
 - Loop protection to avoid broadcast loops
 - Supports ERPS (Ethernet Ring Protection Switching)
- ▶ **Quality of Service**
 - Ingress and egress rate limit per port bandwidth control
 - Storm control support
 - Broadcast/Unknown unicast/Unknown multicast
 - Traffic classification

- IEEE 802.1p CoS
- TOS/DSCP/IP precedence of IPv4/IPv6 packets
- Strict priority and Weighted Round Robin (WRR) CoS policies

► **Multicast**

- Supports IPv4 IGMP snooping v2 and v3
- Supports IPv6 MLD snooping v1, v2
- IGMP querier mode support
- IGMP snooping port filtering
- MLD snooping port filtering

► **Security**

- Authentication
 - IEEE 802.1X port-based network access authentication
 - Built-in RADIUS client to co-operate with the RADIUS servers
 - RADIUS/TACACS+ login user access authentication
- Access control list
 - IPv4/IPv6 IP-based ACL
 - MAC-based ACL
- MAC security
 - Static MAC
 - MAC filtering
- Port security for source MAC address entries filtering
- DHCP snooping to filter distrusted DHCP messages
- Dynamic ARP Inspection discards ARP packets with invalid MAC address to IP address binding
- IP source guard prevents IP spoofing attacks
- DoS attack prevention

► **Management**

- IPv4 and IPv6 dual stack management
- Switch management interface
 - Web switch management
 - Telnet command line interface
 - SNMP v1 and v2c switch management
 - SSHv2, TLSv1.2 and SNMP v3 secure access
- User privilege levels control
- Built-in Trivial File Transfer Protocol (TFTP) client
- BOOTP and DHCP for IP address assignment
- System maintenance
 - Firmware upload/download via HTTP/TFTP
 - Configuration upload/download through web interface
 - Dual images
 - Hardware reset button for system reboot or reset to factory default
- SNTP Network Time Protocol
- Cable diagnostics
- Link Layer Discovery Protocol (LLDP) and LLDP-MED

- SNMP trap for interface link up and link down notification
- Event message logging to remote Syslog server
- Four RMON groups (history, statistics, alarms and events)
- PLANET Smart Discovery Utility for deployment management
- PLANET NMS system and CloudViewer for deployment management

1.3 Product Specifications

| | |
|---|---|
| Product | IGS-801M |
| Hardware Specifications | |
| Hardware Version | 2 |
| Copper Ports | 8 x 10/100/1000BASET RJ45 auto-MDI/MDI-X port |
| Reset Button | < 5 sec: System reboot > 5 sec: Factory default |
| Connector | Removable 6-pin terminal block for power input Pin 1/2 for Power 1; Pin 3/4 for fault alarm; Pin 5/6 for Power 2 |
| Alarm | One relay output for power failure. Alarm relay current carry ability: 1A @ DC 24V |
| Dimensions (W x D x H) | 135 x 87 x 32 mm, 1U height |
| Weight | 472g |
| Power Requirements | DC 12 to 48V AC 24V |
| Power Consumption/ Dissipation | 4.5 watts/15BTU (System on) 10 watts/34BTU (Full loading) |
| ESD Protection | 6KV DC |
| Enclosure | IP30 metal case |
| Installation | DIN-rail kit and wall-mount kit |
| LED | System: Power 1, Power 2, Fault Alarm Ports: 10/100 Link/Act 1000 Link/Act |
| Switching | |
| Switch Architecture | Store-and-Forward |
| Switch Fabric | 16Gbps/non-blocking |
| Switch Throughput@64Bytes | 11.9Mpps |
| Address Table | 8K entries |
| Shared Data Buffer | 4.1 megabits |
| Flow Control | IEEE 802.3x pause frame for full duplex Back pressure for half duplex |
| Jumbo Frame | 10K bytes |
| Layer 2 Functions | |
| Port Mirroring | TX/RX/both Many-to-1 monitor |
| VLAN | 802.1Q tagged VLAN Up to 256 VLAN groups, out of 4094 VLAN IDs 802.1ad Q-in-Q tunneling |

| | |
|-------------------------------------|--|
| | Voice VLAN Protocol VLAN Private VLAN (Protected port) GVRP |
| Link Aggregation | IEEE 802.3ad LACP and static trunk Supports 8 trunk groups with 8 ports per trunk |
| Spanning Tree Protocol | STP, IEEE 802.1D Spanning Tree Protocol RSTP, IEEE 802.1w Rapid Spanning Tree Protocol MSTP, IEEE 802.1s Multiple Spanning Tree Protocol |
| IGMP Snooping | IGMP (v2/v3) snooping IGMP querier Up to 256 multicast groups |
| MLD Snooping | MLD (v1/v2) snooping, up to 256 multicast groups |
| QoS | 8 mapping ID to 8 level priority queues - Port number - 802.1p priority - 802.1Q VLAN tag - DSCP field in IP packet Traffic classification based, strict priority and WRR |
| Ring | Supports ERPS, and complies with ITU-T G.8032 |
| Security Functions | |
| Access Control List | IPv4/IPv6 IP-based ACL/MAC-based ACL |
| Port Security | IEEE 802.1X – Port-based authentication Built-in RADIUS client to cooperate with RADIUS server RADIUS/TACACS+ user access authentication |
| MAC Security | IP-MAC port binding MAC filter Static MAC address |
| Enhanced Security | DHCP Snooping and DHCP Option82 STP BPDU guard, BPDU filtering and BPDU forwarding DoS attack prevention ARP inspection IP source guard |
| Management Functions | |
| Basic Management Interfaces | Web browser Telnet SNMP v1, v2c |
| Secure Management Interfaces | SSHv2, TLS v1.2, SNMP v3 |
| System Management | Firmware upgrade by HTTP/TFTP protocol through Ethernet network LLDP protocol SNTP PLANET Smart Discovery Utility PLANET NMS System/CloudViewer |
| Event Management | Remote/Local Syslog System log |

1.4 How to Use This Manual

This User Manual is structured as follows:

Section 2, INSTALLATION

The section explains the functions of the Switch and how to physically install the Industrial Managed Switch.

Section 3, SWITCH MANAGEMENT

The section contains the information about the software function of the Industrial Managed Switch.

Section 4, WEB CONFIGURATION

The section explains how to manage the Industrial Managed Switch by Web interface.

Section 5, SWITCH OPERATION

The chapter explains how to do the switch operation of the Industrial Managed Switch.

Section 6, TROUBLESHOOTING

The chapter explains how to troubleshoot the Industrial Managed Switch.

Appendix A

The section contains cable information of the Industrial Managed Switch.

2. INSTALLATION

2.1 Hardware Description

This section describes the hardware features and installation of the Industrial Managed Switch on the desktop or rack mount. For easier management and control of the Industrial Managed Switch, familiarize yourself with its display indicators and ports. Front panel illustrations in this chapter display the unit LED indicators. Before connecting any network device to the Industrial Managed Switch, please read this chapter completely.

2.1.1 Physical Dimensions

- IGS-801M Dimensions (W x D x H) : 32 x 87 x 135 mm

2.1.2 Switch Front Panel

The front panel provides a simple interface monitoring of the Industrial Managed Switch. [Figure 2-1-2](#) shows the front panel of the Industrial Managed Switch.

■ Front View

Figure 2-1-2: IGS-801M Front Panel

■ Gigabit TP Interface

10/100/1000BASE-T copper, RJ45 twisted-pair: Up to 100 meters.

■ Reset Button

On the left of the front panel, the reset button is designed to reboot the Industrial Managed Switch without turning off and on the power. The following is the summary table of reset button functions:

| Reset Button | Function |
|---|---------------------------------------|
| Press the reset button for < 5 seconds for system reboot. | Reboot the Industrial Managed Switch. |

Press the reset button for **10 seconds** for factory default.

Reset the Industrial Managed Switch to Factory Default configuration. The Industrial Managed Switch will then reboot and load the default settings shown below:

- Default username: **admin**
- Default password: **admin**
- Default IP address: **192.168.0.100**
- Subnet mask: **255.255.255.0**
- Default gateway: **192.168.0.254**

2.1.3 LED Indications

The front panel LEDs indicate instant status of port links, data activity and system power; it helps monitor and troubleshoot when needed. [Figure 2-1-3](#) shows the LED indications of the Industrial Managed Switch.

Figure 2-1-3: IGS-801M LED Panel

LED Indication

- **System**

| LED | Color | Function |
|-------|-------|---|
| P1 | Green | Indicates power 1 has power. |
| P2 | Green | Indicates power 2 has power. |
| Fault | Green | Indicates either power 1 or power 2 has no power. |

■ Per 10/100/1000BASE-T Port

| LED | Color | Function | |
|-------------------|-------|----------|--|
| 1000 LNK/ACT | Green | Lights | Indicates the port is running at 1000Mbps speed and successfully established. |
| | | Blinks | Indicates that the switch is actively sending or receiving data over that port. |
| | | Off | No device is attached |
| 10/100 LNK/ACT | Green | Lights | Indicates the port is running at 10/100Mbps speed and successfully established. |
| | | Blinks | Indicates that the switch is actively sending or receiving data over that port. |
| | | Off | No device is attached |

2.1.4 Switch Upper Panel

The upper panel of the Industrial Managed Switch consists of one terminal block connector within two DC power inputs. [Figure 2-1-4](#) shows the upper panel of the Industrial Managed Switch.

Figure 2-1-4: IGS-801M Top View

2.1.5 Wiring the Power Inputs

The 6-contact terminal block connector on the top panel of Industrial Managed Switch is used for two redundant power inputs. Please follow the steps below to insert the power wire.

When performing any of the procedures like inserting the wires or tightening the wire-clamp screws, make sure the power is OFF to prevent from getting an electric shock.

1. Insert positive/negative DC power wires into Contacts 1 and 2 for Power 1, or 5 and 6 for power 2.

2. Tighten the wire-clamp screws for preventing the wires from loosening.

| | | | | | |
|----------------|---|---|---|----------------|---|
| 1 | 2 | 3 | 4 | 5 | 6 |
| Power 1 | | | | Power 2 | |
| + | - | | | + | - |

- 1. The power input range is 12V ~ 48V DC and supports 24V AC.
- 2. Use one power input when using 24V AC.

CAUTION

PWR1 and PWR2 must provide the **same DC voltage** while operating with dual power input.

2.1.6 Wiring the Faulty Alarm Contact

The fault alarm contacts are in the middle of the terminal block connector as the picture shows below. Inserting the wires, the Industrial Managed Switch will detect the fault status of the power failure and then forms an open circuit. The following illustration shows an application example for wiring the fault alarm contacts.

The wire gauge for the terminal block should be in the range between 12 and 24 AWG.
 Alarm relay circuit accepts up to 24V AC,1A.

2.1.7 Grounding the Device

Users **MUST** complete grounding wired with the device; otherwise, a sudden lightning could cause fatal damage to the device.

 **Earth Ground**

EMD (Lightning) DAMAGE IS NOT COVERED UNDER WARRANTY.

2.2 Installing the Industrial Managed Switch

This section describes how to install your **Industrial Managed Switch** and make connections to the **Industrial Managed Switch**. Please read the following topics and perform the procedures in the order being presented. To install your **Industrial Managed Switch** on a desktop or shelf, simply complete the following steps.

In this paragraph, we will describe how to install the **Industrial Managed Switch** and the installation points attended to it.

2.2.1 Installation Steps

1. **Unpack the Industrial Managed Switch**
2. **Check if the DIN-rail bracket is screwed on the Industrial Managed Switch or not.** If the DIN rail bracket is not screwed on the **Industrial Managed Switch**, please refer to **DIN-rail Mounting** section for DIN-rail installation. If users want to wall-mount the **Industrial Managed Switch**, please refer to the **Wall-mount Plate Mounting** section for wall-mount plate installation.
3. **To hang the Industrial Managed Switch on the DIN-rail track or wall.**
4. **Power on the Industrial Managed Switch.** Please refer to the **Wiring the Power Inputs** section for how to wire the power. The power LED on the **Industrial Managed Switch** will light up. Please refer to the **LED Indicators** section for indication of LED lights.
5. **Prepare the twisted-pair, straight-through Category 5 cable for Ethernet connection.**
6. **Insert one side of RJ45 cable (category 5) into the Industrial Managed Switch Ethernet port (RJ45 port) while the other side to the network device's Ethernet port (RJ45 port), e.g., Switch PC or Server. The UTP port (RJ45) LED on the **Industrial Managed Switch** will light up when the cable is connected with the network device.** Please refer to the **LED Indicators** section for LED light indication.

Make sure that the connected network devices support MDI/MDI-X. If it does not, use the crossover Category 5 cable.

7. **When all connections are set and all LED lights show normal, the installation is completed.**

2.2.2 DIN-rail Mounting

This section describes how to install the **Industrial Managed Switch**. There are two methods to install the **Industrial Managed Switch** -- DIN-rail mounting and wall-mount plate mounting. Please read the following sections and perform the procedures in the order being presented.

Follow all the DIN-rail installation steps as shown in the example.

Step 1: Screw the DIN rail bracket on the **Industrial Managed Switch**.

Step 2: Lightly slide the DIN rail bracket into the track.

Step 3: Check whether the DIN rail bracket is tightly on the track.

Please refer to the following procedures to remove the **Industrial Managed Switch** from the track.

Step 4: Lightly remove the DIN rail bracket from the track.

2.2.3 Wall-mount Plate Mounting

To install the **Industrial Managed Switch** on the wall, please follow the instructions below.

Follow all the wall-mount installation steps as shown in the example.

Step 1: Remove the DIN rail bracket from the **Industrial Managed Switch**. Use the screwdriver to loosen the screws to remove the DIN-rail bracket.

Step 2: Place the wall-mount plate on the rear panel of the **Industrial Managed Switch**.

Step 3: Use the screwdriver to screw the wall-mount plate on the **Industrial Managed Switch**.

Step 4: Use the hook holes at the corners of the wall mount plate to hang the **Industrial Managed Switch** on the wall.

Step 5: To remove the wall-mount plate, reverse the steps above.

3. SWITCH MANAGEMENT

This chapter explains the methods that you can use to configure management access to the Industrial Managed Switch. It describes the types of management applications and the communication and management protocols that deliver data between your management device (workstation or personal computer) and the system. It also contains information about port connection options.

This chapter covers the following topics:

- Requirements
- Management Access Overview
- Web Management Access
- SNMP Access
- Standards, Protocols, and Related Reading

3.1 Requirements

- Workstations running Windows XP/2003/2008/2012/Vista/7/8/10/11, MAC OS X or later, Linux, UNIX, or other platforms are compatible with TCP/IP protocols.
- Workstations are installed with Ethernet NIC (Network Interface Card)
- **Ethernet Port Connection**
- Network cables -- Use standard network (UTP) cables with RJ45 connectors.
- The above PC is installed with Web browser.

It is recommended to use Chrome 98.0.xxx or above to access the Industrial 802.11ax Wireless AP. If the Web interface of the Industrial 802.11ax Wireless AP is not accessible, please turn off the anti-virus software or firewall and then try it again.

3.2 Management Access Overview

The Industrial Managed Switch gives you the flexibility to access and manage it using any or all of the following methods:

- **Web browser** interface
- An external **SNMP-based network management application**

The administration Web browser interfaces are embedded in the Industrial Managed Switch software and are available for immediate use. Each of these management methods has their own advantages. Table 3-1 compares the three management methods.

| Method | Advantages | Disadvantages |
|--------------------|---|---|
| Web Browser | <ul style="list-style-type: none"> • Ideal for configuring the switch remotely • Compatible with all popular browsers • Can be accessed from any location • Most visually appealing | <ul style="list-style-type: none"> • Security can be compromised (hackers need to only know the IP address and subnet mask) • May encounter lag times on poor connections |
| SNMP Agent | <ul style="list-style-type: none"> • Communicates with switch functions at the MIB level • Based on open standards | <ul style="list-style-type: none"> • Requires SNMP manager software • Least visually appealing of all three methods • Some settings require calculations • Security can be compromised (hackers need to only know the community name) |

Table 3-1: Comparison of Management Methods

3.3 Web Management

The Industrial Managed Switch offers management features that allow users to manage the Industrial Managed Switch from anywhere on the network through a standard browser such as Microsoft Internet Explorer. After you set up your IP address for the switch, you can access the Industrial Managed Switch's Web interface applications directly in your Web browser by entering the IP address of the Industrial Managed Switch.

Figure 3-1-3: Web Management

You can then use your Web browser to list and manage the Industrial Managed Switch configuration parameters from one central location, just as if you were directly connected to the Industrial Managed Switch's Web Management requires **Google Chrome, Safari or Mozilla Firefox 102.0 or later.**

Figure 3-1-4: Web Main Screen of Industrial Managed Switch

3.4 SNMP-based Network Management

You can use an external SNMP-based application to configure and manage the Industrial Managed Switch, such as SNMPC Network Manager, HP Openview Network Node Management (NNM) or What's Up Gold. This management method requires the SNMP agent on the switch and the SNMP Network Management Station to use the **same community string**. This management method, in fact, uses two community strings: the **get community** string and the **set community** string. If the SNMP Network management Station only knows the set community string, it can read and write to the MIBs. However, if it only knows the get community string, it can only read MIBs. The default gets and sets community strings for the Industrial Managed Switch are public.

Figure 3-1-5: SNMP Management

3.5 PLANET Smart Discovery Utility

For easily listing the Industrial Managed Switch in your Ethernet environment, the Planet Smart Discovery Utility from user's manual CD-ROM is an ideal solution. The following installation instructions are to guide you to running the Planet Smart Discovery Utility.

1. Deposit the Planet Smart Discovery Utility in administrator PC.
2. Run this utility as the following screen appears.

Figure 3-1-6: PLANET Smart Discovery Utility Screen

If there are two LAN cards or above in the same administrator PC, choose a different LAN card by using the “Select Adapter” tool.

3. Press the “Refresh” button for the currently connected devices in the discovery list as the screen shows below:

Figure 3-1-7: PLANET Smart Discovery Utility Screen

1. This utility shows all necessary information from the devices, such as MAC address, device name, firmware version and device IP subnet address. It can also assign new password, IP subnet address and description to the devices.
2. After setup is completed, press the “Update Device”, “Update Multi” or “Update All” button to take effect. The meaning of the 3 buttons above are shown below:
 - **Update Device:** Use the current setting on one single device.
 - **Update Multi:** Use the current setting on multi-devices.
 - **Update All:** Use the current setting on whole devices in the list.

The same functions mentioned above also can be found in “Option” tools bar.

3. To click the “Control Packet Force Broadcast” function, it allows you to assign a new setting value to the Web Smart Switch under a different IP subnet address.
4. Press the “Connect to Device” button and the Web login screen appears in [Figure 3-1-4](#).
5. Press the “Exit” button to shut down the Planet Smart Discovery Utility.

4. WEB CONFIGURATION

This section introduces the configuration and functions of the Web-based management.

About Web-based Management

The Industrial Managed Switch offers management features that allow users to manage the Industrial Managed Switch from anywhere on the network through a standard browser such as Google **Chrome**, **Safari** or **Mozilla Firefox 102.0** or later.

The Industrial Managed Switch can be configured through an Ethernet connection, making sure the manager PC must be set to the same IP subnet address as the Industrial Managed Switch.

For example, the default IP address of the Industrial Managed Switch is **192.168.0.100**, then the manager PC should be set to **192.168.0.x** (where x is a number between 1 and 254, except 100), and the default subnet mask is 255.255.255.0.

If you have changed the default IP address of the Industrial Managed Switch to 192.168.1.1 with subnet mask 255.255.255.0 via web, then the manager PC should be set to 192.168.1.x (where x is a number between 2 and 254) to do the related configuration on manager PC.

Figure 4-1-1: Web Management

■ Logging in to the Industrial Managed Switch

1. Use Chrome 98.0 or above for Web browser and enter IP address <https://192.168.0.100> (the factory-default IP address) to access the Web interface.
2. When the following login screen appears, please enter the default username "**admin**" with password "**admin**" (or the username/password you have changed via web) to login the main screen of Industrial Managed Switch. The login screen in [Figure 4-1-2](#) appears.

Figure 4-1-2: Web Login Screen

Default User Name: **admin**

Default Password: **admin**

After entering the username and password, the main screen appears as [Figure 4-1-3](#).

Figure 4-1-3: Default Web Main Page

Now, you can use the Web management interface to continue the switch management or manage the Industrial Managed Switch by Web interface. The Switch Menu on the left of the web page lets you access all the commands and statistics the Industrial Managed Switch provides.

-
- It is recommended to use Chrome 98.0 or above to access Industrial Managed Switch.
 - The changed IP address takes effect immediately after clicking on the **Save** button. You need to use the new IP address to access the Web interface.
-

- For security reason, please change and memorize the new password after this first setup.
 - Only accept command in lowercase letter under Web interface.
-

4.1 Main Web Page

The Industrial Managed Switch provides a Web-based browser interface for configuring and managing it. This interface allows you to access the Industrial Managed Switch using the Web browser of your choice. This chapter describes how to use the Industrial Managed Switch's Web browser interface to configure and manage it.

Figure 4-1-4: Web Main Page

Panel Display

The Web agent displays an image of the Industrial Managed Switch's ports. The Mode can be set to display different information for the ports, including Link up or Link down. Clicking on the image of a port opens the **Port Statistics** page. The port states are illustrated as follows:

| State | Disabled | Down | Link |
|------------|---|---|---|
| RJ45 Ports |  |  |  |

Main Menu

Using the onboard Web agent, you can define system parameters, manage and control the Industrial Managed Switch, and all its ports, or monitor network conditions. Via the Web-Management, the administrator can set up the Industrial Managed Switch by selecting the functions those listed in the Main Function. The screen in [Figure 4-1-5](#) appears.

Figure 4-1-5: Industrial Managed Switch Main Functions Menu

4.1.1 Save Button

This save button allows you to save the running/startup/backup configuration or reset switch in default parameter. The screen in [Figure 4-1-6](#) appears

Figure 4-1-6: Save Button Screenshot

The page includes the following fields:

| Object | Description |
|-----------------------------|---|
| • Save Configuration | Click to save the configuration. For more detailed information, please refer to chapter 4.1.2 |

4.1.2 Configuration Manager

The system file folder contains configuration settings. The screen in [Figure 4-1-7](#) appears.

Figure 4-1-7: Save Button Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------------|--|
| • Running Configuration | <p>Refers to the running configuration sequence use in the switch.</p> <p>In switch, the running configuration file stores in the RAM. In the current version, the running configuration sequence running-config can be saved from the RAM to FLASH by saving “Source File = Running Configuration” to “Destination File = Startup Configuration”, so that the running configuration sequence becomes the startup configuration file, which is called configuration save.</p> <p>To prevent illicit file upload and easier configuration, switch mandates the name of running configuration file to be running-config.</p> |
| • Startup Configuration | <p>Refers to the configuration sequence used in switch startup.</p> <p>Startup configuration file stores in nonvolatile storage, corresponding to the so-called configuration save. If the device supports multi-config file, name the configuration file to be .cfg file, the default is startup.cfg.</p> <p>If the device does not support multi-config file, mandates the name of startup configuration file to be startup-config.</p> |
| • Backup Configuration | The backup configuration is empty in FLASH; please save the backup configuration first by “ Maintenance > Backup Manager ”. |

Buttons

Apply: Click to save configuration.

4.1.2.1 Saving Configuration via the Web

In the Industrial Managed Switch, the running configuration file stores in the RAM. In the current version, the running configuration sequence of running-config can be saved from the RAM to FLASH by "Save Configuration" function, so that the running configuration sequence becomes the startup configuration file, which is called configuration save.

To save all applied changes and set the current configuration as a startup configuration, the startup-configuration file will be loaded automatically across a system reboot.

1. Click "Save > Save Configuration" to log in to the "Configuration Manager" page.

2. Press the "Apply" button to save running configuration to start up configuration.

 A screenshot of the "Save Configuration" section of the Configuration Manager. The section has two tables. The first table, "Source File", has a "Source File" column and a column with three radio buttons: "Running configuration" (selected), "Startup configuration", and "Backup configuration". The second table, "Destination File", has a "Destination File" column and a column with three radio buttons: "Startup configuration" (selected) and "Backup configuration". At the bottom left is a blue "Apply" button, which is highlighted with a red rectangle.

4.2 System

Use the System menu items to display and configure basic administrative details of the Industrial Managed Switch. Under the System, the following topics are provided to configure and view the system information. This section has the following items:

- **System Information** The switch system information is provided here.
- **IP Configurations** Configure the switch-managed IP information on this page.
- **IPv6 Configuration** Configure the switch-managed IPv6 information on this page.
- **User Configuration** Configure new user name and password on this page.
- **Time Settings** Configure SNTP on this page.
- **Log Management** The switch log information is provided here.
- **SNMP Management** Configure SNMP on this page.
- **RMON** Configure the RMON parameters on this page
- **Fault Alarm Configuration** Configure Fault Alarm on this page.
- **Remote Management** Configure NMS controller and CloudViewer Server

4.2.1 System Information

The System Info page provides information for the current device information. System Info page helps a switch administrator to identify the hardware MAC address, software version and system uptime. The screens in [Figure 4-2-1](#) appear.

| Information Name | Information Value |
|------------------|---------------------------------------|
| System Name | Edit IGS-801M |
| System Location | Edit Default Location |
| System Contact | Edit Default Contact |
| MAC Address | A8:F7:E0:77:62:38 |
| IP Address | 192.168.0.100 |
| Subnet Mask | 255.255.255.0 |
| Gateway | 192.168.0.254 |
| Loader Version | 1.0.0.48161 |
| Loader Date | Jan 19 2015 - 13:48:54 |
| Firmware Version | 2.305b210419 |
| Firmware Date | Apr 19 2021 - 13:43:20 |
| System Object ID | 1.3.6.1.4.1.10456.9.8 |
| System Up Time | 0 days, 0 hours, 5 mins, 23 secs |
| PCB/HW Version | V2 |
| Power Status | PWR1:ON PWR2:OFF |

Figure 4-2-1: System Information Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------------------|---|
| • System Name | Display the current system name |
| • System Location | Display the current system location |
| • System Contact | Display the current system contact |
| • MAC Address | The MAC address of this Industrial Managed Switch. |
| • IP Address | The IP address of this Industrial Managed Switch. |
| • Subnet Mask | The subnet mask of this Industrial Managed Switch. |
| • Gateway | The gateway of this Industrial Managed Switch. |
| • Loader Version | The loader version of this Industrial Managed Switch. |
| • Loader Date | The loader date of this Industrial Managed Switch. |
| • Firmware Version | The firmware version of this Industrial Managed Switch. |
| • Firmware Date | The firmware date of this Industrial Managed Switch. |
| • System Object ID | The system object ID of the Industrial Managed Switch. |
| • System Up Time | The period of time the device has been operational. |
| • PCB/HW Version | The hardware version of this Industrial Managed Switch. |
| • Power Status | The Current Status of power input for PWR1 and PWR2. |

Buttons

: Click to edit parameter.

4.2.2 IP Configurations

The IP Configuration includes the IP Address, Subnet Mask and Gateway. The configured column is used to view or change the IP configuration. Fill out the IP Address, Subnet Mask and Gateway for the device. The screens in [Figure 4-2-2](#) and [Figure 4-2-3](#) appear.

| IP Address Setting | |
|---------------------|--|
| Mode | <input checked="" type="radio"/> Static <input type="radio"/> DHCP |
| IP Address | 192.168.0.100 |
| Subnet Mask | 255.255.255.0 |
| Gateway | 192.168.0.254 |
| DNS Server 1 | 168.95.1.1 |
| DNS Server 2 | 168.95.192.1 |

Apply

Figure 4-2-2: IP Address Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|---|
| • Mode | Indicates the IP address mode operation. Possible modes are: Static: Set a IP address that was manually configured for a device. This option allows user to configure each IP parameters manually, including IP Address, Subnet Mask, Default Gateway, and DNS servers. This is usually used in a technical environment of network users. DHCP: Enable DHCP client mode operation. Enable the DHCP client by checking this box. If DHCP fails and the configured IP address is zero, DHCP will retry. If DHCP fails and the configured IP address is non-zero, DHCP will stop and the configured IP settings will be used. The DHCP client will announce the configured System Name as hostname to provide DNS lookup. |
| • IP Address | Provides the IP address of this switch in dotted decimal notation. |
| • Subnet Mask | Provides the subnet mask of this switch in dotted decimal notation. |
| • Gateway | Provides the IP address of the router in dotted decimal notation. |
| • DNS Server 1/2 | Provides the IP address of the DNS Server in dotted decimal notation. |

Buttons

Apply

: Click to apply changes.

| ▼ IP Information | |
|---------------------|-------------------|
| Information Name | Information Value |
| DHCP State | Disable |
| Static IP Address | 192.168.0.100 |
| Static Subnet Mask | 255.255.255.0 |
| Static Gateway | 192.168.0.254 |
| Static DNS Server 1 | 168.95.1.1 |
| Static DNS Server 2 | 168.95.192.1 |

Figure 4-2-3: IP Information Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|-----------------------------------|
| • DHCP State | Displays the current DHCP state. |
| • IP Address | Displays the current IP address. |
| • Subnet Mask | Displays the current subnet mask. |
| • Gateway | Displays the current gateway. |
| • DNS Server 1/2 | Displays the current DNS server. |

4.2.3 IPv6 Configuration

The IPv6 Configuration includes Auto Configuration, IPv6 Address and Gateway. The configured column is used to view or change the IPv6 configuration. Fill out the Auto Configuration, IPv6 Address and Gateway for the device. The screens in [Figure 4-2-4](#) and [Figure 4-2-5](#) appear.

| IPv6 Address Setting | |
|--------------------------------------|---|
| Auto Configuration | <input type="radio"/> Disable <input checked="" type="radio"/> Enable |
| IPv6 Address | :: / 0 |
| Gateway | :: |
| DHCPv6 Client | <input checked="" type="radio"/> Disable <input type="radio"/> Enable |
| <input type="button" value="Apply"/> | |

Figure 4-2-4: IPv6 Address Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------------------|---|
| • Auto Configuration | Enable IPv6 auto-configuration by checking this box. If it fails, the configured IPv6 address is zero. The router may delay responding to a router solicitation for a few seconds; the total time needed to complete auto-configuration can be significantly longer. |
| • IPv6 Address | Provide the IPv6 address of this switch. IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:). For example, 'fe80::215:c5ff:fe03:4dc7'. The symbol '::' is a special syntax that can be used as a shorthand way of representing multiple 16-bit groups of contiguous zeros; but it can only appear once. It also uses the following legally IPv4 address. For example, ':192.1.2.34'. Provide the IPv6 Prefix of this switch. The allowed range is 1 through 128 . |
| • Gateway | Provide the IPv6 gateway address of this switch. IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:). For example, 'fe80::215:c5ff:fe03:4dc7'. |
| • DHCPv6 Client | To enable this Industrial Managed Switch to accept a configuration from a Dynamic Host Configuration Protocol version 6 (DHCPv6) server. By default, the Industrial Managed Switch does not perform DHCPv6 client |

| | |
|--|---|
| | actions. DHCPv6 clients request the delegation of long-lived prefixes that they can push to individual local hosts. |
|--|---|

Buttons

Apply

: Click to apply changes.

The screenshot shows a table titled "IPv6 Information" with the following data:

| Information Name | Information Value |
|---------------------|----------------------------|
| Auto Configuration | Enabled |
| IPv6 In Use Address | fe80::2e0:4cff:fe00:0 / 64 |
| IPv6 In Use Router | :: |
| IPv6 Static Address | fe80::2e0:4cff:fe00:0 / 0 |
| IPv6 Static Router | :: |
| DHCPv6 Client | Disabled |

Figure 4-2-5: IPv6 Information Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------------|---|
| • Auto Configuration | Displays the current auto configuration state |
| • IPv6-in-Use Address | Displays the currently-used IPv6 address |
| • IPv6-in-Use Router | Displays the currently-used gateway |
| • IPv6 Static Address | Displays the current IPv6 static address |
| • IPv6 Static Router | Displays the current IPv6 static gateway |
| • DHCPv6 Client | Displays the current DHCPv6 client status |

4.2.4 User Configuration

This page provides an overview of the current users and privilege type. Currently the only way to login as another user on the Web server is to close and reopen the browser. After the setup is completed, please press the “**Apply**” button to take effect. Please login Web interface with a new user name and password; the screens in [Figure 4-2-6](#) and [Figure 4-2-7](#) appear.

| New User | | | | | |
|----------------------|---|--------------------------|--------------------------|--|------------------------------------|
| User Name | Password Type | Password | Retype Password | Privilege Type | Privilege Value |
| <input type="text"/> | Clear Text <input type="button" value="▼"/> | <input type="password"/> | <input type="password"/> | Admin <input type="button" value="▼"/> | 2 <input type="button" value="▼"/> |
| Apply | | | | | |

Figure 4-2-6: Local User Information Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------|---|
| • Username | The name identifying the user. Maximum length: 32 characters; Maximum number of users: 8 |
| • Password Type | The password type for the user. |
| • Password | Enter the user's new password here. (Range: 0-32 characters plain text, case sensitive) |
| • Retype Password | Please enter the user's new password here again to confirm. |
| • Privilege Type | The privilege type for the user. Options: <ul style="list-style-type: none">• Admin• User• Other |

| • Privilege Type | Displays the current privilege type |
| • Modify | Click to modify the local user entry Delete : Delete the current user |

4.2.5 Time Settings

4.2.5.1 System Time

Configure SNTP on this page. **SNTP** is an acronym for **Simple Network Time Protocol**, a network protocol for synchronizing the clocks of computer systems. You can specify SNTP Servers and set GMT Time zone. The SNTP Configuration screens in [Figure 4-2-8](#) and [Figure 4-2-9](#) appear.

System Time Setting

| | |
|------------------------------------|--|
| Enable SNTP | <input checked="" type="radio"/> Disable <input type="radio"/> Enable |
| Manual Time | Year <input type="text" value="2000"/> Month <input type="text" value="Jan"/> Day <input type="text" value="1"/> Hours <input type="text" value="0"/> Minutes <input type="text" value="0"/> Seconds <input type="text" value="0"/> |
| Time Zone | <input type="text" value="None"/> |
| Daylight Saving Time | <input type="text" value="Disable"/> |
| Daylight Saving Time Offset | <input type="text" value="60"/> (1 - 1440) Minutes |
| Recurring From | Day <input type="text" value="Sun"/> Week <input type="text" value="1"/> Month <input type="text" value="Jan"/> Hours <input type="text" value="0"/> Minutes <input type="text" value="0"/> |
| Recurring To | Day <input type="text" value="Sun"/> Week <input type="text" value="1"/> Month <input type="text" value="Jan"/> Hours <input type="text" value="0"/> Minutes <input type="text" value="0"/> |
| Non-recurring From | Year <input type="text" value="2000"/> Month <input type="text" value="Jan"/> Date <input type="text" value="1"/> Hours <input type="text" value="0"/> Minutes <input type="text" value="0"/> |
| Non-recurring To | Year <input type="text" value="2000"/> Month <input type="text" value="Jan"/> Date <input type="text" value="1"/> Hours <input type="text" value="0"/> Minutes <input type="text" value="0"/> |
| Apply | |

Figure 4-2-8: SNTP Setup Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------|---|
| • Enable SNTP | <p>Enabled: Enable SNTP mode operation. When enabling SNTP mode operation, the agent forwards and transfers SNTP messages between the clients and the server when they are not on the same subnet domain.</p> <p>Disabled: Disable SNTP mode operation.</p> |

| | |
|--------------------------------------|--|
| • Manual Time | To set time manually. • Year - Select the starting Year. • Month - Select the starting month. • Day - Select the starting day. • Hours - Select the starting hour. • Minutes - Select the starting minute. • Seconds - Select the starting seconds. |
| • Time Zone | Allows to select the time zone according to the current location of switch. |
| • Daylight Saving Time | This is used to set the clock forward or backward according to the configurations set below for a defined Daylight Saving Time duration. Select 'Disable' to disable the Daylight Saving Time configuration. Select 'Recurring' and configure the Daylight Saving Time duration to repeat the configuration every year. Select 'Non-Recurring' and configure the Daylight Saving Time duration for single time configuration. (Default: Disabled). |
| • Daylight Saving Time Offset | Enter the number of minutes to add during Daylight Saving Time. (Range: 1 to 1440) |
| • Recurring From | • Week - Select the starting week number. • Day - Select the starting day. • Month - Select the starting month. • Hours - Select the starting hour. • Minutes - Select the starting minute. |

4.2.6 Log Management

The Industrial Managed Switch log management is provided here. The local logs allow you to configure and limit system messages that are logged to flash or RAM memory. The default is for event levels 0 to 3 to be logged to flash and levels 0 to 6 to be logged to RAM. The following table lists the event levels of the Industrial Managed Switch:

| Level | Severity Name | Description |
|-------|----------------------|---|
| 7 | Debug | Debugging messages. |
| 6 | Informational | Informational messages only. |
| 5 | Notice | Normal but significant condition, such as cold start. |
| 4 | Warning | Warning conditions (e.g., return false, unexpected return). |
| 3 | Error | Error conditions (e.g., invalid input, default used). |
| 2 | Critical | Critical conditions (e.g., memory allocation, or free memory error - resource exhausted). |
| 1 | Alert | Immediate action needed. |
| 0 | Emergency | System unusable. |

4.2.6.1 Local Log

The switch system local log information is provided here. The local Log screens in [Figure 4-2-12](#) and [Figure 4-2-13](#) appear.

Figure 4-2-12: Logging Settings Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------|--|
| • Logging Service | Enabled: Enable logging service operation. Disabled: Disable logging service operation. |

Buttons

 A screenshot of a web-based configuration interface titled "Logging Information". It shows a table with one row for "Logging Service" set to "enabled". There is also an "Apply" button with a tooltip explaining its function.

| Information Name | Information Value |
|------------------|-------------------|
| Logging Service | enabled |

Figure 4-2-13: Logging Information Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------|---|
| • Logging Service | Display the current logging service status. |

4.2.6.2 Local Log

The switch system local log information is provided here. The local Log screens in [Figure 4-2-14](#) and [Figure 4-2-15](#) appear.

The screenshot shows a user interface titled "Local Logging Setting". It has two main sections: "Target" and "Severity". The "Target" section contains a dropdown menu labeled "Select Targets". The "Severity" section contains a dropdown menu with the value "emerg" selected. At the bottom is a blue "Apply" button.

Figure 4-2-14: Local Log Target Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|------------|--|
| • Target | The target of the local log entry. The following target types are supported: <ul style="list-style-type: none"> ■ Buffered: Target the buffer of the local log. ■ File: Target the file of the local log. |
| • Severity | The severity of the local log entry. The following severity types are supported: <ul style="list-style-type: none"> ■ emerg: Emergency level of the system unstable for local log. ■ alert: Alert level of the immediate action needed for local log. ■ crit: Critical level of the critical conditions for local log. ■ error: Error level of the error conditions for local log. ■ warning: Warning level of the warning conditions for local log. ■ notice: Notice level of the normal but significant conditions for local log. ■ info: Informational level of the informational messages for local log. ■ debug: Debug level of the debugging messages for local log. |

Buttons

: Click to apply changes.

| Local Logging Setting Status | | | |
|------------------------------|----------|--|---------------|
| Status | Target | Severity | Action |
| enabled | buffered | emerg, alert, crit, error, warning, notice | Delete |

Figure 4-2-15: Local Log Setting Status Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------|--|
| • Status | Displays the current local log state. |
| • Target | Displays the current local log target. |
| • Severity | Displays the current local log severity. |
| • Action | Delete : Delete the current status. |

4.2.6.3 Remote Syslog

Configure remote syslog on this page. The Remote Syslog page allows you to configure the logging of messages that are sent to syslog servers or other management stations. You can also limit the event messages sent to only those messages below a specified level.

The Remote Syslog screens in Figure 4-2-16 and Figure 4-2-17 appear.

Remote Logging Setting

| Server Address | Server Port | Severity | Facility |
|----------------------|---------------|--|---|
| <input type="text"/> | 514 (1-65535) | emerg <input type="button" value="▼"/> | local0 <input type="button" value="▼"/> |

Apply

Figure 4-2-16: Remote Log Target Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|--|
| • Server Address | Provides the remote syslog IP address of this switch. |
| • Server Port | Provides the port number of remote syslog server. Default Port no.: 514 |
| • Severity | The severity of the local log entry. The following severity types are supported: <ul style="list-style-type: none"> ■ emerg: Emergency level of the system unstable for local log. ■ alert: Alert level of the immediate action needed for local log. ■ crit: Critical level of the critical conditions for local log. ■ error: Error level of the error conditions for local log. ■ warning: Warning level of the warning conditions for local log. ■ notice: Notice level of the normal but significant conditions for local log. ■ info: Informational level of the informational messages for local log. ■ debug: Debug level of the debugging messages for local log. |
| • Facility | Local0~7 : local user 0~7. |

Buttons

Apply : Click to apply changes.

▼ Remote Logging Setting Status

| Status | Server Info | Severity | Facility | Action |
|--------|-------------|----------|----------|---------------|
| | | | | Delete |

Figure 4-2-17: Remote Log Setting Status Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------|--|
| • Status | Displays the current remote syslog state. |
| • Server Info | Displays the current remote syslog server information. |
| • Severity | Displays the current remote syslog severity. |
| • Facility | Displays the current remote syslog facility. |
| • Action | Delete : Delete the remote server entry. |

4.2.6.4 Log Message

The switch log view is provided here. The Log View screens in Figure 4-2-18, Figure 4-2-19 and Figure 4-2-20 appear.

Figure 4-2-18: Log Information Select Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------|---|
| • Target | The target of the log view entry. The following target types are supported: <ul style="list-style-type: none"> ■ Buffered: Target the buffered of the log view. ■ File: Target the file of the log view. |
| • Severity | The severity of the log view entry. The following severity types are supported: <ul style="list-style-type: none"> ■ emerg: Emergency level of the system unstable for log view. ■ alert: Alert level of the immediate action needed for log view. ■ crit: Critical level of the critical conditions for log view. ■ error: Error level of the error conditions for log view. ■ warning: Warning level of the warning conditions for log view. ■ notice: Notice level of the normal but significant conditions for log view. ■ info: Informational level of the informational messages for log view. ■ debug: Debug level of the debugging messages for log view. |
| • Category | The category of the log view includes: AAA, ACL, CABLE_DIAG, DAI, DHCP_SNOOPING, Dot1X, GVRP, IGMP_SNOOPING, IPSG, L2, LLDP, Mirror, MLD_SNOOPING, Platform, PM, Port, PORT_SECURITY, QoS, Rate, SNMP and STP. |

Buttons

View : Click to view log.

▼ Logging Information

| Information Name | Information Value |
|------------------|--|
| Target | buffered |
| Severity | emerg, alert, crit, error, warning, notice |
| Category | AAA, ACL, CABLE_DIAG, DAI, DHCP_SNOOPING, Dot1X, GVRP, IGMP_SNOOPING, IPSG, L2, LLDP, Mirror, MLD_SNOOPING, Platform, PM, Port, PORT_SECURITY, QoS, Rate, SNMP, STP, Security-suite, System, Trunk, VLAN |
| Total Entries | 1 |

Figure 4-2-19: Logging Information Page Screenshot

The page includes the following fields:

| Object | Description |
|------------------------|------------------------------------|
| • Target | Displays the current log target. |
| • Severity | Displays the current log severity. |
| • Category | Displays the current log category. |
| • Total Entries | Displays the current log entries. |

The screenshot shows a web-based interface for viewing log messages. At the top, there is a header bar with a dropdown menu labeled "Logging Messages". Below the header are two buttons: "Clear buffered messages" and "Refresh". Underneath these buttons is a navigation bar with links: "FIRST", "PREV", "1", "NEXT", and "LAST". The main content area is a table with five columns: "No.", "Timestamp", "Category", "Severity", and "Message". A single log entry is displayed in the table:

| No. | Timestamp | Category | Severity | Message |
|-----|----------------------|----------|----------|------------------|
| 1 | Jan 01 2000 08:00:19 | Port | notice | Port gi1 link up |

Figure 4-2-20: Logging Messages Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------|------------------------------|
| • No. | This is the number for logs. |
| • Timestamp | Displays the time of log. |
| • Category | Displays the category type. |
| • Severity | Displays the severity type. |
| • Message | Displays the log message. |

Buttons

Clear : Click to clear the log.

Refresh : Click to refresh the log.

4.2.7 SNMP Management

4.2.7.1 SNMP Overview

The **Simple Network Management Protocol (SNMP)** is an application layer protocol that facilitates the exchange of management information between network devices. It is part of the **Transmission Control Protocol/Internet Protocol (TCP/IP)** protocol suite. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

An SNMP-managed network consists of three key components: Network management stations (NMS's), SNMP agents, Management information base (MIB) and network-management protocol:

- **Network management stations (NMS's):** Sometimes called consoles, these devices execute management applications that monitor and control network elements. Physically, NMS's are usually engineering workstation-caliber computers with fast CPUs, megapixel color displays, substantial memory, and abundant disk space. At least one NMS must be present in each managed environment.
- **Agents :** Agents are software modules that reside in network elements. They collect and store management information such as the number of error packets received by a network element.
- **Management information base (MIB) :** A MIB is a collection of managed objects residing in a virtual information store. Collections of related managed objects are defined in specific MIB modules.
- **Network-management protocol :** A management protocol is used to convey management information between agents and NMS's. SNMP is the Internet community's de facto standard management protocol.

SNMP Operations

SNMP itself is a simple request/response protocol. NMS's can send multiple requests without receiving a response.

- **Get** -- Allows the NMS to retrieve an object instance from the agent.
- **Set** -- Allows the NMS to set values for object instances within an agent.
- **Trap** -- Used by the agent to asynchronously inform the NMS of some event. The SNMPv2 trap message is designed to replace the SNMPv1 trap message.

SNMP community

An SNMP community is the group that devices and management stations running SNMP belong to. It helps define where information is sent. The community name is used to identify the group. An SNMP device or agent may belong to more than one SNMP community. It will not respond to requests from management stations that do not belong to one of its communities.

SNMP default communities are:

- **Write** = private
- **Read** = public

4.2.7.2 SNMP Setting

Configure SNMP setting on this page. The SNMP System global setting screens in [Figure 4-2-21](#) & [Figure 4-2-22](#) appear.

The screenshot shows a configuration interface for SNMP Global Setting. At the top, it says "SNMP Global Setting". Below that is a row with two buttons: "State" (highlighted in blue) and "Disabled" (selected). There is also an "Enabled" button. At the bottom left is a blue "Apply" button.

Figure 4-2-21: SNMP Global Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|----------|--|
| • Status | Indicates the SNMP mode operation. Possible modes are: Enabled: Enable SNMP mode operation. Disabled: Disable SNMP mode operation. |

Buttons

Apply: Click to apply changes.

The screenshot shows a configuration interface for SNMP Informations. At the top, there is a dropdown menu with "▼ SNMP Informations" selected. Below it is a table with two columns: "Information Name" and "Information Value". The table has one row where the name is "SNMP" and the value is "Disabled".

Figure 4-2-22: SNMP Information Page Screenshot

The page includes the following fields:

| Object | Description |
|--------|-----------------------------------|
| • SNMP | Displays the current SNMP status. |

4.2.7.3 SNMP Community

Configure SNMP Community on this page. The SNMP Community screens in [Figure 4-2-27](#) and [Figure 4-2-28](#) appear.

| Community Setting | | | | |
|------------------------------------|--|----------------------|--------------------------------------|-------------------------------------|
| Community Name | Community Mode | Group Name | View Name | Access Right |
| <input type="text"/> | Basic <input type="button" value="▼"/> | <input type="text"/> | all <input type="button" value="▼"/> | ro <input type="button" value="▼"/> |
| <input type="button" value="Add"/> | | | | |

Figure 4-2-27: Community Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|---|
| • Community Name | Indicates the community read/write access string to permit access to SNMP agent. The allowed string length is 0 to 16. |
| • Community Mode | Indicates the SNMP community supported mode. Possible versions are: ■ Basic : Set SNMP community mode supported version 1 and 2c. ■ Advanced : Set SNMP community mode supported version 3. |
| • Group Name | A string identifying the group name that this entry should belong to. The allowed string length is 1 to 16. |
| • View Name | A string identifying the view name that this entry should belong to. The allowed string length is 1 to 16. |
| • Access Right | Indicates the SNMP community type operation. Possible types are: RO=Read-Only : Set access string type in read-only mode. RW=Read-Write : Set access string type in read-write mode. |

Buttons

: Click to apply changes.

| Community Status | | | | |
|------------------|------------|-----------|--------------|---------------------------------------|
| Community Name | Group Name | View Name | Access Right | Action |
| public | | all | rw | <input type="button" value="Delete"/> |

Figure 4-2-28: Community Status Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|--|
| • Community Name | Displays the current community type. |
| • Group Name | Displays the current SNMP access group's name. |
| • View Name | Displays the current view name. |
| • Access Right | Displays the current access type. |
| • Delete | Delete : Delete the community entry. |

4.2.7.4 SNMP View

Configure SNMPv3 view table on this page. The entry index keys are **View Name** and **OID Subtree**. The SNMPv3 View Table Setting screens in [Figure 4-2-23](#) and [Figure 4-2-24](#) appear.

View Table Setting

| View Name | Subtree OID | Subtree OID Mask | View Type |
|----------------------|----------------------|--------------------------|--|
| <input type="text"/> | <input type="text"/> | <input type="text"/> all | <input checked="" type="radio"/> included <input type="radio"/> excluded |

Add

Figure 4-2-23: SNMPv3 View Table Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------------------|---|
| • View Name | A string identifying the view name that this entry should belong to. The allowed string length is 1 to 16. |
| • Subtree OID | The OID defining the root of the subtree to add to the named view. The allowed string content is digital number or asterisk (*). |
| • Subtree OID Mask | The bitmask identifies which positions in the specified object identifier are to be regarded as "wildcards" for the purpose of pattern-matching. |
| • View Type | Indicates the view type that this entry should belong to. Possible view type are: included : An optional flag to indicate that this view subtree should be included. excluded : An optional flag to indicate that this view subtree should be excluded. General, if a view entry's view type is 'excluded', it should exist another view entry in which view type is 'included' and its OID subtree oversteps the 'excluded' view entry. |

Buttons

Add

: Click to add a new view entry.

| View Table Status | | | | |
|-------------------|-------------|----------|-----------|--------|
| View Name | Subtree OID | OID Mask | View Type | Action |
| all | .1 | all | included | |

Figure 4-2-24: SNMP View Table Status Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------|--|
| • View Name | Displays the current SNMP view name. |
| • Subtree OID | Displays the current SNMP subtree OID. |
| • OID Mask | Displays the current SNMP OID mask. |
| • View Type | Displays the current SNMP view type. |
| • Action | Delete : Delete the view table entry. |

4.2.7.5 SNMP Access Group

Configure SNMPv3 access group on this page. The entry index keys are **Group Name**, **Security Model** and **Security Level**.

The SNMPv3 Access Group Setting screens in [Figure 4-2-25](#) and [Figure 4-2-26](#) appear.

| Access Group Setting | | | | | |
|----------------------|----------------|----------------|----------------|-----------------|------------------|
| Group Name | Security Model | Security Level | Read View Name | Write View Name | Notify View Name |
| <input type="text"/> | v1 | noauth | all | None | None |
| Add | | | | | |

Figure 4-2-25: SNMPv3 Access Group Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|--|
| • Group Name | A string identifying the group name that this entry should belong to. The allowed string length is 1 to 16. |
| • Security Model | Indicates the security model that this entry should belong to. Possible security models are: <ul style="list-style-type: none"> ■ v1: Reserved for SNMPv1. ■ v2c: Reserved for SNMPv2c. |

| | |
|---------------------------|--|
| | <ul style="list-style-type: none"> ■ V3: Reserved for SNMPv3 or User-based Security Model (USM) |
| • Security Level | <p>Indicates the security model that this entry should belong to.</p> <p>Possible security models are:</p> <ul style="list-style-type: none"> ■ Noauth: None authentication and none privacy security levels are assigned to the group. ■ auth: Authentication and none privacy. ■ priv: Authentication and privacy. <p>Note: The Security Level applies to SNNPv3 only.</p> |
| • Read View Name | <p>Read view name is the name of the view in which you can only view the contents of the agent.</p> <p>The allowed string length is 1 to 16.</p> |
| • Write View Name | <p>Write view name is the name of the view in which you enter data and configure the contents of the agent.</p> <p>The allowed string length is 1 to 16.</p> |
| • Notify View Name | <p>Notify view name is the name of the view in which you specify a notify, inform, or trap.</p> |

Buttons

Add

: Click to add a new access entry.

Delete

: Check to delete the entry.

| Access Group Status | | | | | | |

| Group Name | Security Model | Security Level | Read View Name | Write View Name | Notify View Name | Action |
| | | | | | | |

Figure 4-2-26: SNMP View Table Status Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------------------|--|
| • Group Name | Displays the current SNMP access group name. |
| • Security Model | Displays the current security model. |
| • Security Level | Displays the current security level. |
| • Read View Name | Displays the current read view name. |
| • Write View Name | Displays the current write view name. |
| • Notify View Name | Displays the current notify view name. |
| • Action | <input type="button" value="Delete"/> : Delete the access group entry. |

4.2.7.6 SNMP User

Configure SNMPv3 users table on this page. Each SNMPv3 user is defined by a unique name. Users must be configured with a specific security level and assigned to a group. The SNMPv3 group restricts users to a specific read, write, and notify view. The entry index key is **User Name**. The SNMPv3 User Setting screens in [Figure 4-2-29](#) and [Figure 4-2-30](#) appear.

| User Setting | | | | | | |
|------------------------------------|----------------------------------|-------------------------------------|---------------------------------------|-------------------------------------|---------------------------------------|-------------------------------------|
| User Name | Group | Privilege Mode | Authentication Protocol | Authentication Password | Encryption Protocol | Encryption Key |

Figure 4-2-30: SNMPv3 Users Status Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------------------|--|
| • User Name | Displays the current user name. |
| • Group | Displays the current group. |
| • Privilege Mode | Displays the current privilege mode. |
| • Authentication Protocol | Displays the current authentication protocol. |
| • Encryption Protocol | Displays the current encryption protocol. |
| • Access Right | Displays the current access right. |
| • Action | <input type="button" value="Delete"/> : Delete the user entry. |

4.2.7.7 SNMPv1, 2 Notification Recipients

Configure SNMPv1 and 2 notification recipients on this page. The SNMPv1, 2 Notification Recipients screens in [Figure 4-2-31](#) and [Figure 4-2-32](#) appear.

SNMPv1,2 Host Setting

| Server Address | SNMP Version | Notify Type | Community Name | UDP Port | TimeOut | Retries |
|----------------------|--------------|-------------|----------------|------------------|---------------|--------------|
| <input type="text"/> | v1 | Traps | public | 162 (1-65535) | 15 (1-300) | 3 (1-255) |

Add

Figure 4-2-31: SNMPv1, 2 Notification Recipients Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|--|
| • Server Address | Indicates the SNMP trap destination address. It allows a valid IP address in dotted decimal notation ('x.y.z.w'). It can also represent a legally valid IPv4 address. For example, '::192.1.2.34'. |
| • SNMP Version | Indicates the SNMP trap supported version. Possible versions are: ■ SNMP v1 : Set SNMP trap supported version 1. ■ SNMP v2c : Set SNMP trap supported version 2c. |
| • Notify Type | Set the notify type in traps or informs. |
| • Community Name | Indicates the community access string when send SNMP trap packet. |
| • UDP Port | Indicates the SNMP trap destination port. SNMP Agent will send SNMP message via this port, the port range is 1~65535. |
| • Time Out | Indicates the SNMP trap inform timeout. The allowed range is 1 to 300. |
| • Retries | Indicates the SNMP trap inform retry times. The allowed range is 1 to 255. |

Buttons

Add : Click to add a new SNMPv1, 2 host entry.

SNMPv1,2 Host Status

| Server Address | SNMP Version | Notify Type | Community Name | UDP Port | Time Out | Retry | Action |
|----------------|--------------|-------------|----------------|----------|----------|-------|--------|
|----------------|--------------|-------------|----------------|----------|----------|-------|--------|

Figure 4-2-32: SNMPv1, 2 Host Status Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|--|
| • Server Address | Displays the current server address |
| • SNMP Version | Displays the current SNMP version |
| • Notify Type | Displays the current notify type |
| • Community Name | Displays the current community name |
| • UDP Port | Displays the current UDP port |
| • Time Out | Displays the current time out |
| • Retries | Displays the current retry times |
| • Action | Delete : Delete the SNMPv1, 2 host entry. |

4.2.7.8 SNMPv3 Notification Recipients

Configure SNMPv3 notification recipients on this page. The SNMPv1, 2 Notification Recipients screens in [Figure 4-2-33](#) and [Figure 4-2-34](#) appear.

| SNMPv3 Host Setting | | | | | |
|----------------------|--|----------------------|--|---------------------------------------|--------------------------------------|
| Server Address | Notify Type | User Name | UDP Port | TimeOut | Retries |
| <input type="text"/> | Traps <input type="button" value="▼"/> | <input type="text"/> | 162 <input type="text" value="1-65535"/> | 15 <input type="text" value="1-300"/> | 3 <input type="text" value="1-255"/> |
| Add | | | | | |

Figure 4-2-33: SNMPv3 Notification Recipients Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|--|
| • Server Address | Indicates the SNMP trap destination address. It allows a valid IP address in dotted decimal notation ('x.y.z.w'). It can also represent a legally valid IPv4 address. For example, '::192.1.2.34'. |
| • Notify Type | Set the notify type in traps or informs. |
| • User Name | Indicates the user string when send SNMP trap packet. |
| • UDP Port | Indicates the SNMP trap destination port. SNMP Agent will send SNMP message via this port, the port range is 1~65535. |
| • Time Out | Indicates the SNMP trap inform timeout. The allowed range is 1 to 300. |
| • Retries | Indicates the SNMP trap inform retry times. The allowed range is 1 to 255. |

Buttons

| Object | Description |
|-------------------------|---|
| • Server Address | Displays the current server address. |
| • Notify Type | Displays the current notify type. |
| • User Name | Displays the current user name. |
| • UDP Port | Displays the current UDP port. |
| • Time Out | Displays the current time out. |
| • Retries | Displays the current retry times. |
| • Action | Delete : Delete the SNMPv3 host entry. |

4.2.7.9 SNMP Engine ID

Configure SNMPv3 Engine ID on this page. The entry index key is Engine ID. The remote engine ID is used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host. The SNMPv3 Engine ID Setting screens in [Figure 4-2-35](#) and [Figure 4-2-36](#) appear.

| Engine ID Settings | |
|--------------------|---|
| Use Default | <input checked="" type="radio"/> Enabled <input type="radio"/> Disabled |
| Engine ID | 80006a92030000304f1122 (10-64) |
| Apply | |

Figure 4-2-35: SNMPv3 Engine ID Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------|--|
| • Engine ID | An octet string identifying the engine ID that this entry should belong to. The string must contain an even number between 10 and 64 hexadecimal digits, but all-zeros and all-'F's are not allowed. |

Buttons

Apply

|----------------------------|---|
| • Remote IP Address | Displays the current remote IP address. |
| • Engine ID | Displays the current engine ID. |
| • Action | : Delete the remote IP address entry. |

4.2.8 RMON

4.2.8.1 RMON Statistics

This page provides a Detail of a specific RMON statistics entry; RMON Statistics screen in [Figure 4-2-39](#) appears.

| Port GE1 RMON Statistics | |
|--------------------------|---------|
| Port | GE1 |
| Drop Events | 0 |
| Octets | 3107588 |
| Packets | 17698 |
| Broadcast Packets | 223 |
| Multicast Packets | 457 |
| CRC / Alignment Errors | 0 |
| Undersize Packets | 0 |
| Oversize Packets | 0 |
| Fragments | 0 |
| Jabbers | 0 |
| Collisions | 0 |
| 64 Bytes Frame | 9489 |
| 65-127 Byte Frames | 4588 |
| 128-255 Byte Frames | 150 |
| 256-511 Byte Frames | 20 |
| 512-1023 Byte Frames | 3453 |
| 1024-1518 Byte Frames | 0 |

Figure 4-2-39: RMON Statistics Detail Page Screenshot

The Page includes the following fields:

| Object | Description |
|-------------------------------|---|
| • Port | Select port from this drop-down list |
| • Drop Events | The total number of events in which packets were dropped by the probe due to lack of resources |
| • Octets | The total number of octets of data (including those in bad packets) received on the network |
| • Packets | The total number of packets (including bad packets, broadcast packets, and multicast packets) received |
| • Broadcast Packets | The total number of good packets received that were directed to the broadcast address |
| • Multicast Packets | The total number of good packets received that were directed to a multicast address |
| • CRC/Alignment Errors | The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets |

| | |
|--------------------------------|--|
| • Undersize Packets | The total number of packets received that were less than 64 octets |
| • Oversize Packets | The total number of packets received that were longer than 1518 octets |
| • Fragments | The number of frames which size is less than 64 octets received with invalid CRC |
| • Jabbers | The number of frames which size is larger than 64 octets received with invalid CRC |
| • Collisions | The best estimate of the total number of collisions on this Ethernet segment. |
| • 64 Bytes Frame | The total number of packets (including bad packets) received that were 64 octets in length |
| • 65~127 Byte Frames | The total number of packets (including bad packets) received that were between 65 to 127 octets in length |
| • 128~255 Byte Frames | The total number of packets (including bad packets) received that were between 128 to 255 octets in length |
| • 256~511 Byte Frames | The total number of packets (including bad packets) received that were between 256 to 511 octets in length |
| • 512~1023 Byte Frames | The total number of packets (including bad packets) received that were between 512 to 1023 octets in length |
| • 1024~1518 Byte Frames | The total number of packets (including bad packets) received that were between 1024 to 1518 octets in length |

Buttons

: Click to clear the RMON statistics

4.2.8.2 RMON Event

Configure RMON Event table on this page. The RMON Event screens in [Figure 4-2-40](#) & [Figure 4-2-41](#) appear.

| RMON Event | |
|--------------------------------------|--|
| Select Index | <input type="button" value="Create New"/> |
| Index | <input type="text" value="0"/> (1-65535) |
| Type | <input type="button" value="None"/> |
| Community | <input type="button"/> |
| Owner | <input type="text" value=""/> (0~31 Charactors) |
| Description | <input type="text" value=""/>  (0~127 Charactors) |
| <input type="button" value="Apply"/> | |

Figure 4-2-40: RMON Event Configuration Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------------|---|
| • Select Index | Select index from this drop-down list to create new index or modify index |
| • Index | Indicates the index of the entry. The range is from 1 to 65535 |
| • Type | Indicates the notification of the event, the possible types are: ■ none : The total number of octets received on the interface, including framing characters. ■ log : The number of uni-cast packets delivered to a higher-layer protocol. ■ SNMP-Trap : The number of broad-cast and multi-cast packets delivered to a higher-layer protocol. ■ Log and Trap : The number of inbound packets that are discarded even the packets are normal. |
| • Community | Specify the community when trap is sent, the string length is from 0 to 127, default is "public". |
| • Owner | Indicates the owner of this event, the string length is from 0 to 127, default is a null string |
| • Description | Indicates description of this event, the string length is from 0 to 127, default is a null string |

Buttons

: Click to apply changes.

| Index | Event Type | Community | Description | Last Sent Time | Owner | Action |
|-------|------------|-----------|-------------|----------------|-------|--------|
|-------|------------|-----------|-------------|----------------|-------|--------|

Figure 4-2-41: RMON Event Status Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|--|
| • Index | Displays the current event index |
| • Event Type | Displays the current event type |
| • Community | Displays the current community for SNMP trap |
| • Description | Displays the current event description |
| • Last Sent Time | Displays the current last sent time |
| • Owner | Displays the current event owner |
| • Action | Click  to delete RMON event entry |

4.2.8.3 RMON Event Log

This page provides an overview of RMON Event Log. The RMON Event Log Table screen in [Figure 4-2-42](#) appears.

Figure 4-2-42: RMON Event Log Table Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------------|---------------------------------------|
| • Select Index | Select index from this drop-down list |
| • Index | Indicates the index of the log entry |
| • Log Time | Indicates Event log time |
| • Description | Indicates the Event description |

4.2.8.4 RMON Alarm

Configure RMON Alarm table on this page. The RMON Alarm screens in [Figure 4-2-43](#)& [Figure 4-2-44](#) appear.

| RMON Alarm | |
|-------------------|---|
| Select Index | Create New |
| Index | 0 (1-65535) |
| Sample Port | GE1 |
| Sample Variable | DropEvents |
| Sample Interval | 0 (1-2147483647) |
| Sample Type | <input type="radio"/> absolute <input checked="" type="radio"/> delta |
| Rising Threshold | 0 (0-2147483647) |
| Falling Threshold | 0 (0-2147483647) |
| Rising Event | 0: None (Unassigned) |
| Falling Event | 0: None (Unassigned) |
| Owner | (0~31 Charactors) |

Apply

Figure 4-2-43: RMON Alarm Table Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------|---|
| • Select Index | Select index from this drop-down list to create the new index or modify the index |
| • Index | Indicates the index of the alarm entry |
| • Sample Port | Select port from this drop-down list |
| • Sample Variable | <p>Indicates the particular variable to be sampled, the possible variables are:</p> <ul style="list-style-type: none"> ■ DropEvents: The total number of events in which packets were dropped due to lack of resources. ■ Octets: The number of received and transmitted (good and bad) bytes. Includes FCS, but excludes framing bits. ■ Pkts: The total number of frames (bad, broadcast and multicast) received and transmitted. ■ BroadcastPkts: The total number of good frames received that were directed to the broadcast address. Note that this does not include multicast packets. ■ MulticastPkts: The total number of good frames received that were directed to this multicast address. ■ CRCAlignErrors: The number of CRC/alignment errors (FCS or alignment errors). ■ UnderSizePkts: The total number of frames received that were less than 64 octets long(excluding framing bits, but including FCS octets) and were otherwise well formed. ■ OverSizePkts: The total number of frames received that were longer than 1518 octets(excluding framing bits, but including FCS octets) and were otherwise well formed. ■ Fragments: The total number of frames received that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS or alignment error. ■ Jabbers: The total number of frames received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS or alignment error. ■ Collisions: The best estimate of the total number of collisions on this Ethernet segment. ■ Pkts64Octets: The total number of frames (including bad packets) received and transmitted that were 64 octets in length (excluding framing bits but including FCS octets). ■ Pkts64to172Octets: The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets). |

| | |
|----------------------------|---|
| | <ul style="list-style-type: none"> ■ Pkts158to255Octets: The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets). ■ Pkts256to511Octets: The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets). ■ Pkts512to1023Octets: The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets). ■ Pkts1024to1518Octets: The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets). |
| • Sample Interval | Sample interval (1–2147483647) |
| • Sample Type | <p>The method of sampling the selected variable and calculating the value to be compared against the thresholds, possible sample types are:</p> <ul style="list-style-type: none"> ■ Absolute: Get the sample directly (default). ■ Delta: Calculate the difference between samples. |
| • Rising Threshold | Rising threshold value (0–2147483647) |
| • Falling Threshold | Falling threshold value (0–2147483647) |
| • Rising Event | Event to fire when the rising threshold is crossed |
| • Falling Event | Event to fire when the falling threshold is crossed |
| • Owner | Specify an owner for the alarm |

Buttons

Apply

: Click to apply changes.

4.2.8.6 RMON History Log

This page provides a detail of RMON history entries; screen in Figure 4-2-47 appears.

The screenshot shows a web-based interface for managing RMON history. At the top, there is a blue header bar with the title "RMON History Table". Below the header, there is a dropdown menu labeled "History Index" with the option "Select History" and a small arrow icon. A large gray rectangular area below contains the text "No data available!" in blue capital letters.

Figure 4-2-47: RMON History Status Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------|---|
| • History Index | Select history index from this drop-down list |

Buttons

Apply: Click to apply changes.

4.2.9 Fault Alarm Configuration

This Page facilitates a fault alarm controlling the switch. The Fault Alarm Control Configuration screen in Figure 4-2-48 appears.

The screenshot shows a configuration page for fault alarms. The title is "Fault Alarm Output". There are five rows of settings with checkboxes:

- Enable:** Radio buttons for "Enable" (selected) and "Disable".
- Record:** Checkboxes for "System Log" and "SNMP Trap".
- Action:** Checkboxes for "Power Fail" and "Port Fail" (both selected).
- Power Alarm:** Checkboxes for "PWR1" and "PWR2" (both selected).
- Port Alarm:** Checkboxes for ports 1 through 8 (only port 1 is selected).

 At the bottom is a blue "Apply" button.

Figure 4-2-48: Fault Alarm Control Configuration Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------|---|
| • Enable | Controls whether Fault Alarm is enabled or disabled on this switch. |
| • Record | Controls whether Record is sending System log or SNMP Trap or both. |
| • Action | Controls whether Port Fail or Power Fail or both for fault detecting. |
| • Power Alarm | Controls whether DC1 or DC2 or both for fault detecting. |
| • Port Alarm | Controls which Ports or all for fault detecting. |

Buttons

: Click to apply changes.

4.2.10 Remote Management

The Industrial Managed Switch can support both NMS contoleer and CloudViewer Sever for remote management. PLANET's **NMS Controller** is a Network Management System can monitor all kinds of deployed network devices, such as managed switches, media converters, routers, smart APs, VoIP phones, IP cameras, etc., compliant with the SNMP Protocol, ONVIF Protocol and PLANET Smart Discovery utility. The **CloudViewer** is a free networking service just for PLANET Products. This service provides simplified network monitoring and real-time network status. Working with PLANET CloudViewer app, user can easily check network status, device information, Port and PoE status from Internet. Any other services are not included.

The Remote NMS Configuration screens in [Figure 4-2-49](#) appear.

Figure 4-2-49: Fault Alarm Control Configuration Page Screenshot

The NMS Controller – LAN Configuration screens in [Figure 4-2-50](#) appear.

Remote NMS Configuration

| | |
|----------------------------------|--|
| Remote NMS Enable | PLANET NMS Controller - LAN |
| NMS Controller IP address | 0.0.0.0 |
| Authorization Status |  Disabled |

| Object | Description |
|------------------------------------|---|
| • Remote NMS Enable | Enable NMS management |
| • NMS Controller IP address | The IP address of NMS Controller |
| • Authorization Status | Indicate the authorization status of the switch to NMS Controller |

The CloudViewer Server – Internet screens in [Figure 4-2-51](#) appear.

Remote NMS Configuration

| | |
|--------------------------|--------------------------------------|
| Remote NMS Enable | PLANET CloudViewer Server - Internet |
| Subscriber email | test@planet.com.tw |
| Password | ***** |
| Status | Success |

Figure 4-2-51 CloudViewer Server – Internet Configuration Page Screenshot

| Object | Description |
|----------------------------|--|
| • Remote NMS Enable | Enable NMS management |
| • Subscriber email | The email registered on CloudViewer Server |
| • Password | The password of your CloudViewer account |
| • Status | Indicate the status of connecting CloudViewer Server |

4.3 Port Management

Use the Port Menu to display or configure the Industrial Managed Switch's ports. This section has the following items:

- **Port Configuration** Configures port configuration settings
- **Port Counters** Lists Ethernet and RMON port statistics
- **Bandwidth Utilization** Displays current bandwidth utilization
- **Port Mirroring** Sets the source and target ports for mirroring
- **Jumbo Frame** Sets the jumbo frame on the switch
- **Port Error Disable Configuration** Configures port error disable settings
- **Port Error Disabled Status** Disables port error status
- **Protected Ports** Configures protected ports settings
- **EEE** Configures EEE settings

4.3.1 Port Configuration

This page displays current port configurations and status. Ports can also be configured here. The table has one row for each port on the selected switch in a number of columns, which are:

The Port Configuration screens in [Figure 4-3-1](#) and [Figure 4-3-2](#) appear.

The screenshot shows a web-based interface for managing port settings. At the top, there is a title bar labeled "Port settings". Below it is a table with five columns: "Port Select", "Enabled", "Speed", "Duplex", and "Flow Control". The "Port Select" column contains a dropdown menu labeled "Select Ports". The "Enabled" column has two radio buttons: "Enabled" (selected) and "Disabled". The "Speed" and "Duplex" columns each have dropdown menus set to "Auto". The "Flow Control" column has two radio buttons: "Enabled" (disabled) and "Disabled" (selected). At the bottom left of the form is a blue "Apply" button.

Figure 4-3-1: Port Settings Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------|---|
| • Port Select | Select port number for this drop down list. |
| • Enabled | Indicates the port state operation. Possible state are: Enabled - Start up the port manually. Disabled – Shut down the port manually. |
| • Speed | Select any available link speed for the given switch port. Draw the menu bar to select the mode. ■ Auto – Set up Auto negotiation. |

| | |
|-----------------------|--|
| | <ul style="list-style-type: none"> ■ Auto-10M – Set up 10M Auto negotiation. ■ Auto-100M – Set up 100M Auto negotiation. ■ Auto-1000M – Set up 1000M Auto negotiation. ■ Auto-10/100M – Set up 10/100M Auto negotiation. ■ 10M – Set up 10M Force mode. ■ 100M – Set up 100M Force mode. ■ 1000M – Set up 1000M Force mode. |
| • Duplex | Select any available link duplex for the given switch port. Draw the menu bar to select the mode. <ul style="list-style-type: none"> ■ Auto – Set up Auto negotiation. ■ Full - Force sets Full-Duplex mode. ■ Half - Force sets Half-Duplex mode. |
| • Flow Control | When Auto Speed is selected for a port, this section indicates the flow control capability that is advertised to the link partner. When a fixed-speed setting is selected, that is what is used. Current Rx column indicates whether pause frames on the port are obeyed. Current Tx column indicates whether pause frames on the port are transmitted. The Rx and Tx settings are determined by the result of the last Auto-Negotiation. Check the configured column to use flow control. This setting is related to the setting for Configured Link Speed. |

Buttons

Figure 4-3-2: Port Status Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------------------|---|
| • Port | This is the logical port number for this row. |
| • Description | Click Edit to indicate the port name. |
| • Enable State | Display the current port state. |
| • Link Status | Display the current link status. |
| • Speed | Display the current speed status of the port. |
| • Duplex | Display the current duplex status of the port. |
| • Flow Control Configuration | Display the current flow control configuration of the port. |
| • Flow Control Status | Display the current flow control status of the port. |

4.3.2 Port Counters

This page provides an overview of traffic and trunk statistics for all switch ports. The Port Statistics screens in [Figure 4-3-3](#), [Figure 4-3-4](#), [Figure 4-3-5](#) and [Figure 4-3-6](#) appear.

Figure 4-3-3: Port MIB Counters Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------|--|
| • Port | Select port number from this drop-down list. |
| • Mode | Select port counters mode. Option: <ul style="list-style-type: none"> • All • Interface • Ether-link • RMON |

| Interface Counters | Counters Value |
|----------------------------------|----------------|
| Received Octets | 0 |
| Received Unicast Packets | 0 |
| Received Unknown Unicast Packets | 0 |
| Received Discards Packets | 0 |
| Transmit Octets | 0 |
| Transmit Unicast Packets | 0 |
| Transmit Unknown Unicast Packets | 0 |
| Transmit Discards Packets | 0 |
| Received Multicast Packets | 0 |
| Received Broadcast Packets | 0 |
| Transmit Multicast Packets | 0 |
| Transmit Broadcast Packets | 0 |

Figure 4-3-4: Interface Counters Page Screenshot

| Object | Description |
|---|---|
| • Received Octets | The total number of octets received on the interface, including framing characters. |
| • Received Unicast Packets | The number of subnetwork-unicast packets delivered to a higher-layer protocol. |
| • Received Unknown Unicast Packets | The number of packets received via the interface which is discarded because of an unknown or unsupported protocol. |
| • Received Discards Packets | A number of inbound packets are chosen to be discarded even though no errors have been detected to prevent them from being delivered to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. |
| • Transmit Octets | The total number of octets transmitted out of the interface, including framing characters. |
| • Transmit Unicast Packets | The total number of packets that higher-level protocols requested is transmitted to a subnetwork-unicast address, including those that were discarded or not sent. |
| • Transmit Unknown Unicast Packets | The total number of packets that higher-level protocols requested is transmitted to a subnetwork-unicast address, including those that were discarded or not sent. |
| • Transmit Discards Packets | The number of inbound packets which is chosen to be discarded even though no errors have been detected to prevent from being delivered to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. |
| • Received Multicast Packets | The number of packets, delivered by this sub-layer to a higher (sub-) layer, is addressed to a multicast address at this sub-layer. |
| • Received Broadcast | The number of packets, delivered by this sub-layer to a higher (sub-) layer, |

| | |
|-------------------------------------|--|
| Packets | addressed to a broadcast address at this sub-layer. |
| • Transmit Multicast Packets | The total number of packets that higher-level protocols requested is transmitted and is addressed to a multicast address at this sub-layer, including those that were discarded or not sent. |
| • Transmit Broadcast Packets | The total number of packets that higher-level protocols requested is transmitted, and addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. |

| Ethernet-link Counters | Counters Value |
|----------------------------|----------------|
| Alignment Errors | 0 |
| FCS Errors | 0 |
| Single Collision Frames | 0 |
| Multiple Collision Frames | 0 |
| Deferred Transmissions | 0 |
| Late Collision | 0 |
| Excessive Collision | 0 |
| Frame Too Longs | 0 |
| Symbol Errors | 0 |
| Control In Unknown Opcodes | 0 |
| In Pause Frames | 0 |
| Out Pause Frames | 0 |

Figure 4-3-5: Ethernet link Counters Page Screenshot

| Object | Description |
|------------------------------------|---|
| • Alignment Errors | The number of alignment errors (mis-synchronized data packets). |
| • FCS Errors | A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. |
| • Single Collision Frames | The number of successfully transmitted frames for which transmission is inhibited by exactly one collision. |
| • Multiple Collision Frames | A count of successfully transmitted frames for which transmission is inhibited by more than one collision. |
| • Deferred Transmissions | A count of frames for which the first transmission attempt on a particular interface is delayed because the medium was busy. |
| • Late Collision | The number of times that a collision is detected later than 512 bit-times into the transmission of a packet. |
| • Excessive Collision | A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increase when the interface is operating in full-duplex mode. |

| | |
|-------------------------------------|---|
| • Frame Too Long | A count of frames received on a particular interface that exceeds the maximum permitted frame size. |
| • Symbol Errors | The number of received and transmitted symbol errors. |
| • Control In Unknown Opcodes | The number of received control unknown opcodes. |
| • In Pause Frames | The number of received pause frames. |
| • Out Pause Frames | The number of transmitted pause frames. |

| RMON Counters | Counters Value |
|------------------------|----------------|
| Drop Events | 0 |
| Octets | 0 |
| Packets | 0 |
| Broadcast Packets | 0 |
| Multicast Packets | 0 |
| CRC / Alignment Errors | 0 |
| Undersize Packets | 0 |
| Oversize Packets | 0 |
| Fragments | 0 |
| Jabbers | 0 |
| Collisions | 0 |
| 64 Bytes Frame | 0 |
| 65-127 Byte Frames | 0 |
| 128-255 Byte Frames | 0 |
| 256-511 Byte Frames | 0 |
| 512-1023 Byte Frames | 0 |
| 1024-1518 Byte Frames | 0 |

Figure 4-3-6: RMON Counters Page Screenshot

| Object | Description |
|----------------------------|--|
| • Drop Events | The total number of events in which packets were dropped due to lack of resources. |
| • Octets | The total number of octets received and transmitted on the interface, including framing characters. |
| • Packets | The total number of packets received and transmitted on the interface. |
| • Broadcast Packets | The total number of good frames received that were directed to the broadcast address. Note that this does not include multicast packets. |
| • Multicast Packets | The total number of good frames received that were directed to this multicast address. |

| | |
|--|--|
| • CRC/Alignment Errors | The number of CRC/alignment errors (FCS or alignment errors). |
| • Undersize Packets | The total number of frames received that were less than 64 octets long(excluding framing bits, but including FCS octets) and were otherwise well formed. |
| • Oversize Packets | The total number of frames received that were longer than 1518 octets(excluding framing bits, but including FCS octets) and were otherwise well formed. |
| • Fragments | The total number of frames received that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS or alignment error. |
| • Jabbers | The total number of frames received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS or alignment error. |
| • Collisions | The best estimate of the total number of collisions on this Ethernet segment. |
| • 64 Bytes Frames | The total number of frames (including bad packets) received and transmitted that were 64 octets in length (excluding framing bits but including FCS octets). |
| • 65-127 Byte Frames 128-255 Byte Frames 256-511 Byte Frames 512-1023 Byte Frames 1024-1518 Byte Frames | The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets). |

4.3.3 Bandwidth Utilization

The **Bandwidth Utilization** page displays the percentage of the total available bandwidth being used on the ports. Bandwidth utilization statistics can be viewed using a line graph. The Bandwidth Utilization screen in [Figure 4-3-7](#) appears.

To view the port utilization, click on the **Port Management** folder and then the **Bandwidth Utilization** link:

Figure 4-3-7: Port Bandwidth Utilization Page Screenshot

The page includes the following fields:

| Object | Description |
|---|---|
| <ul style="list-style-type: none"> • Refresh Period | <p>This shows the period interval between last and next refresh.</p> <p>Options:</p> <ul style="list-style-type: none"> ■ 2 sec ■ 5 sec ■ 10 sec |
| <ul style="list-style-type: none"> • IFG | Allows user to enable or disable this function. |

4.3.4 Port Mirroring

Configure port Mirroring on this page. This function provides monitoring of network traffic that forwards a copy of each incoming or outgoing packet from one port of a network switch to another port where the packet can be studied. It enables the manager to keep close track of switch performance and alter it if necessary.

- To debug network problems, selected traffic can be copied, or mirrored, to a mirror port where a frame analyzer can be attached to analyze the frame flow.
- The Industrial Managed Switch can unobtrusively mirror traffic from any port to a monitor port. You can then attach a protocol analyzer or RMON probe to this port to perform traffic analysis and verify connection integrity.

Port Mirror Application

Figure 4-3-8: Port Mirror Application

The traffic to be copied to the mirror port is selected as follows:

- All frames received on a given port (also known as ingress or source mirroring).
- All frames transmitted on a given port (also known as egress or destination mirroring).

Mirror Port Configuration

The Port Mirror Configuration screens in [Figure 4-3-9](#) and [Figure 4-3-10](#) appear.

| Mirror Setting | |
|---|---|
| Session ID | <select style="width: 100%;">Select Session</select> |
| Monitor session state | <select style="width: 100%;">Disable</select> |
| Destination Port | <select style="width: 100%;">GE1</select> |
| allow-ingress | <select style="width: 100%;">Disable</select> |
| Sniffer RX Ports | <select style="width: 100%;">Select RX Ports</select> |
| Sniffer TX Ports | <select style="width: 100%;">Select TX Ports</select> |
| <input style="width: 100px; margin-left: 10px;" type="button" value="Apply"/> | |

Figure 4-3-9: Port Mirroring Settings Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------------|---|
| • Session ID | Set the port mirror session ID. Possible ID are: 1 to 4 . |
| • Monitor Session State | Enable or disable the port mirroring function. |
| • Destination Port | Select the port to mirror destination port. |
| • Allow-ingress | Frames from ports that have either source (rx) or destination (tx) mirroring enabled are mirrored to this port. |
| • Sniffer TX Ports | Frames transmitted from these ports are mirrored to the mirroring port. Frames received are not mirrored. |
| • Sniffer RX Ports | Frames received at these ports are mirrored to the mirroring port. Frames transmitted are not mirrored. |

Buttons

: Click to apply changes.

The page includes the following fields:

| Object | Description |
|----------------|--|
| • Jumbo | Displays the current maximum frame size. |

4.3.6 Port Error Disabled Configuration

This page provides to set port error disable function. The Port Error Disable Configuration screens in [Figure 4-3-13](#) and [Figure 4-3-14](#) appear.

| Error Disabled Recovery | |
|--------------------------------|---|
| Recovery Interval | <input type="text" value="300"/> (Seconds) |
| BPDU Guard | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| Self Loop | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| Broadcast Flood | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| Unknown Multicast Flood | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| Unicast Flood | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| ACL | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| Port Security Violation | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| DHCP rate limit | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| ARP rate limit | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| Apply | |

Figure 4-3-13: Error Disabled Recovery Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------------------|--|
| • Recovery Interval | The period (in seconds) for which a port will be kept disabled in the event of a port error is detected (and the port action shuts down the port). |
| • BPDU Guard | Enable or disable the port error disabled function to check status by BPDU guard. |
| • Self Loop | Enable or disable the port error disabled function to check status by self loop. |
| • Broadcast Flood | Enable or disable the port error disabled function to check status by broadcast flood. |
| • Unknown Multicast Flood | Enable or disable the port error disabled function to check status by unknown multicast flood. |
| • Unicast Flood | Enable or disable the port error disabled function to check status by unicast flood. |
| • ACL | Enable or disable the port error disabled function to check status by ACL. |
| • Port Security Violation | Enable or disable the port error disabled function to check status by port security violation. |
| • DHCP Rate Limit | Enable or disable the port error disabled function to check status by DHCP rate limit |
| • ARP Rate Limit | Enable or disable the port error disabled function to check status by ARP rate limit |

Buttons
Apply

: Click to apply changes.

| ▼ Error Disable Information | |
|-----------------------------|-------------------|
| Information Name | Information Value |
| Recovery Interval | 300 |
| BPDU Guard | disabled |
| Self Loop | disabled |
| Broadcast Flood | disabled |
| Unknown Multicast Flood | disabled |
| Unicast Flood | disabled |
| ACL | disabled |
| Port Security Violation | disabled |
| DHCP rate limit | disabled |
| ARP rate limit | disabled |

Figure 4-3-14: Error Disabled Information Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------------------|--|
| • Recovery Interval | Displays the current recovery interval time. |
| • BPDU Guard | Displays the current BPDU guard status. |
| • Self Loop | Displays the current self loop status. |
| • Broadcast Flood | Displays the current broadcast flood status. |
| • Unknown Multicast Flood | Displays the current unknown multicast flood status. |
| • Unicast Flood | Displays the current unicast flood status. |
| • ACL | Displays the current ACL status. |
| • Port Security Violation | Displays the current port security violation status. |
| • DHCP Rate Limit | Displays the current DHCP rate limit status. |
| • ARP Rate Limit | Displays the current ARP rate limit status. |

4.3.7 Port Error Disabled Status

This page provides disable that transitions a port into error disable and the recovery options. The ports were disabled by some protocols such as **BPDU Guard**, **Loopback** and **UDLD**. The Port Error Disable screen in [Figure 4-3-15](#) appears.

| ▼ Port Error Disabled Status | | |
|------------------------------|-----------------------|---------------------|
| Port Name | Error Disabled Reason | Time Left (Seconds) |
| | | |

Figure 4-3-15 : Port Error Disable Page Screenshot

The displayed counters are:

| Object | Description |
|-------------------------------|---|
| • Port Name | Displays the port for error disable. |
| • Error Disable Reason | Displays the error disabled reason of the port. |
| • Time Left (Seconds) | Displays the time left. |

4.3.8 Protected Ports

Overview

When a switch port is configured to be a member of **protected group** (also called **Private VLAN**), communication between protected ports within that group can be prevented. Two application examples are provided in this section:

- Customers connected to an ISP can be members of the protected group, but they are not allowed to communicate with each other within that VLAN.
- Servers in a farm of web servers in a Demilitarized Zone (DMZ) are allowed to communicate with the outside world and with database servers on the inside segment, but are not allowed to communicate with each other

For protected port group to be applied, the Industrial Managed Switch must first be configured for standard VLAN operation.

Ports in a protected port group fall into one of these two groups:

- **Promiscuous (Unprotected) ports**
 - Ports from which traffic can be forwarded to all ports in the private VLAN
 - Ports which can receive traffic from all ports in the private VLAN
- **Isolated (Protected) ports**
 - Ports from which traffic can only be forwarded to promiscuous ports in the private VLAN
 - Ports which can receive traffic from only promiscuous ports in the private VLAN

The configuration of promiscuous and isolated ports applies to all private VLANs. When traffic comes in on a promiscuous port in a private VLAN, the VLAN mask from the VLAN table is applied. When traffic comes in on an isolated port, the private VLAN mask is applied in addition to the VLAN mask from the VLAN table. This reduces the ports to which forwarding can be done to just the promiscuous ports within the private VLAN.

The port settings relate to the currently unit, as reflected by the page header. The Port Isolation Configuration screens in [Figure 4-3-16](#) and [Figure 4-3-17](#) appear.

Figure 4-3-16: Protected Ports Settings Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------|---|
| • Port List | Select port number for this drop down list. |
| • Port Type | Displays protected port types. <ul style="list-style-type: none"> - Protected: A single stand-alone VLAN that contains one promiscuous port and one or more isolated (or host) ports. This VLAN conveys traffic between the isolated ports and a lone promiscuous port. - Unprotected: A promiscuous port can communicate with all the interfaces within a private VLAN. This is the default setting. |

| • Protected Ports | Displays the current protected ports. |
| • Unprotected Ports | Displays the current unprotected ports. |

4.3.9 EEE

What is EEE?

Energy Efficient Ethernet (EEE) is a power saving option that reduces the power usage when there is low or no traffic utilization. EEE works by powering down circuits when there is no traffic. When a port gets data to be transmitted, all circuits are powered up. The time it takes to power up the circuits is named wakeup time. The default wakeup time is 17 us for 1Gbit links and 30 us for other link speeds. EEE devices must agree upon the value of the wakeup time in order to make sure that both the receiving and transmitting device has all circuits powered up when traffic is transmitted. The devices can exchange wakeup time information using the LLDP protocol. EEE works for ports in auto-negotiation mode, where the port is negotiated to either 1G or 100 Mbit full duplex mode. For ports that are not EEE-capable the corresponding EEE checkboxes are grayed out and thus impossible to enable EEE for. The EEE port settings relate to the currently unit, as reflected by the page header.

When a port is powered down for saving power, outgoing traffic is stored in a buffer until the port is powered up again. Because there are some overhead in turning the port down and up, more power can be saved if the traffic can be buffered up until a large burst of traffic can be transmitted. Buffering traffic will give some latency in the traffic.

The EEE Port Settings screens in [Figure 4-3-18](#) and [Figure 4-3-19](#) appear.

| EEE Port Settings | |

Figure 4-3-19: EEE-enabled Status Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------|---|
| • Port | The switch port number of the logical port. |
| • EEE State | Displays the current EEE state. |

4.4 Link Aggregation

Port Aggregation optimizes port usage by linking a group of ports together to form a single Link Aggregated Groups (LAGs).

Port Aggregation multiplies the bandwidth between the devices, increases port flexibility, and provides link redundancy.

Each LAG is composed of ports of the same speed, set to full-duplex operations. Ports in a LAG can be of different media types (UTP/Fiber, or different fiber types) provided they operate at the same speed.

Aggregated Links can be assigned manually (**Port Trunk**) or automatically by enabling Link Aggregation Control Protocol (**LACP**) on the relevant links.

Aggregated Links are treated by the system as a single logical port. Specifically, the Aggregated Link has similar port attributes to a non-aggregated port, including auto-negotiation, speed, duplex setting, etc.

The device supports the following Aggregation links :

- **Static LAGs (Port Trunk)** – Force aggregated selected ports to be a trunk group.
- **Link Aggregation Control Protocol (LACP)** LAGs - LACP LAG negotiate Aggregated Port links with other LACP ports located on a different device. If the other device ports are also LACP ports, the devices establish a LAG between them.

Figure 4-4-1: Link Aggregation

The **Link Aggregation Control Protocol (LACP)** provides a standardized means for exchanging information between Partner Systems that require high-speed redundant links. Link aggregation lets you group up to eight consecutive ports into a single dedicated connection. This feature can expand bandwidth to a device on the network. LACP operation requires full-duplex mode. For more detailed information, refer to the IEEE 802.3ad standard.

Port link aggregations can be used to increase the bandwidth of a network connection or to ensure fault recovery. Link aggregation lets you group up to 8 consecutive ports into a single dedicated connection between any two the Switch or other Layer 2 switches. However, before making any physical connections between devices, use the Link Aggregation Configuration menu to specify the link aggregation on the devices at both ends. When using a port link aggregation, note that:

- The ports used in a link aggregation must all be of the same media type (RJ45, 100 Mbps fiber).
- The ports that can be assigned to the same link aggregation have certain other restrictions (see below).
- Ports can only be assigned to one link aggregation.
- The ports at both ends of a connection must be configured as link aggregation ports.
- None of the ports in a link aggregation can be configured as a mirror source port or a mirror target port.
- All of the ports in a link aggregation have to be treated as a whole when moved from/to, added or deleted from a VLAN.
- The Spanning Tree Protocol will treat all the ports in a link aggregation as a whole.
- Enable the link aggregation prior to connecting any cable between the switches to avoid creating a data loop.
- Disconnect all link aggregation port cables or disable the link aggregation ports before removing a port link aggregation to avoid creating a data loop.

It allows a maximum of 8 ports to be aggregated at the same time. The Industrial Managed Switch supports Gigabit Ethernet ports (up to 8 groups). If the group is defined as an LACP static link aggregation group, then any extra ports selected are placed in a standby mode for redundancy if one of the other ports fails. If the group is defined as a local static link aggregation group, then the number of ports must be the same as the group member ports.

Use the Link Aggregation Menu to display or configure the Trunk function. This section has the following items:

- | | |
|----------------------------|--|
| ■ LAG Setting | Configures load balance algorithm configuration settings |
| ■ LAG Management | Configures LAG configuration settings |
| ■ LAG Port Setting | Configures LAG port settings |
| ■ LACP Setting | Configures LACP priority settings |
| ■ LACP Port Setting | Configures LACP configuration settings |
| ■ LAG Status | Displays LAG status / LACP information |

4.4.1 LAG Setting

This page allows configuring load balance algorithm configuration settings. The LAG Setting screens in [Figure 4-4-2](#) and [Figure 4-4-3](#) appear.

Figure 4-4-2: LAG Setting Page Screenshot

The page includes the following fields:

| Object | Description |

4.5 VLAN

4.5.1 VLAN Overview

A **Virtual Local Area Network (VLAN)** is a network topology configured according to a logical scheme rather than the physical layout. VLAN can be used to combine any collection of LAN segments into an autonomous user group that appears as a single LAN. VLAN also logically segments the network into different broadcast domains so that packets are forwarded only between ports within the VLAN. Typically, a VLAN corresponds to a particular subnet, although not necessarily.

VLAN can enhance performance by conserving bandwidth, and improve security by limiting traffic to specific domains.

A VLAN is a collection of end nodes grouped by logic instead of physical location. End nodes that frequently communicate with each other are assigned to the same VLAN, regardless of where they are physically on the network. Logically, a VLAN can be equated to a broadcast domain, because broadcast packets are forwarded to only members of the VLAN on which the broadcast was initiated.

-
1. No matter what basis is used to uniquely identify end nodes and assign these nodes VLAN membership, packets cannot cross VLAN without a network device performing a routing function between the VLAN.
 2. The Industrial Managed Switch supports IEEE 802.1Q VLAN. The port untagging function can be used to remove the 802.1 tag from packet headers to maintain compatibility with devices that are tag-unaware.
-

The Industrial Managed Switch's default is to assign all ports to a single 802.1Q VLAN named **DEFAULT_VLAN**. As new VLAN is created, the member ports assigned to the new VLAN will be removed from the DEFAULT_VLAN port member list. **The DEFAULT_VLAN has a VID = 1.**

This section has the following items:

- **Management VLAN** Configures the management VLAN
- **Create VLAN** Creates the VLAN group
- **Interface Settings** Configures mode and PVID on the VLAN port
- **Port to VLAN** Configures the VLAN membership
- **Port VLAN Membership** Displays the VLAN membership
- **Protocol VLAN Group Setting** Configures the protocol VLAN group
- **Protocol VLAN Port Setting** Configures the protocol VLAN port setting
- **GVRP Setting** Configures GVRP global setting
- **GVRP Port Setting** Configures GVRP port setting
- **GVRP VLAN** Displays the GVRP VLAN database
- **GVRP Statistics** Displays the GVRP port statistics

4.5.2 IEEE 802.1Q VLAN

In large networks, routers are used to isolate broadcast traffic for each subnet into separate domains. This Industrial Managed Switch provides a similar service at Layer 2 by using VLANs to organize any group of network nodes into separate broadcast domains. VLANs confine broadcast traffic to the originating group, and can eliminate broadcast storms in large networks. This also provides a more secure and cleaner network environment.

An IEEE 802.1Q VLAN is a group of ports that can be located anywhere in the network, but communicate as though they belong to the same physical segment.

VLANs help to simplify network management by allowing you to move devices to a new VLAN without having to change any physical connections. VLANs can be easily organized to reflect departmental groups (such as Marketing or R&D), usage groups (such as e-mail), or multicast groups (used for multimedia applications such as videoconferencing).

VLANs provide greater network efficiency by reducing broadcast traffic, and allow you to make network changes without having to update IP addresses or IP subnets. VLANs inherently provide a high level of network security since traffic must pass through a configured Layer 3 link to reach a different VLAN.

This Industrial Managed Switch supports the following VLAN features:

- Up to 255 VLANs based on the IEEE 802.1Q standard
- Port overlapping, allowing a port to participate in multiple VLANs
- End stations can belong to multiple VLANs
- Passing traffic between VLAN-aware and VLAN-unaware devices

■ IEEE 802.1Q Standard

IEEE 802.1Q (tagged) VLAN is implemented on the Switch. 802.1Q VLAN requiring tagging, which enables them to span the entire network (assuming all switches on the network are IEEE 802.1Q-compliant).

VLAN allows a network to be segmented in order to reduce the size of broadcast domains. All packets entering a VLAN will only be forwarded to the stations (over IEEE 802.1Q enabled switches) that are members of that VLAN, and this includes broadcast, multicast and unicast packets from unknown sources.

VLAN can also provide a level of security to your network. IEEE 802.1Q VLAN will only deliver packets between stations that are members of the VLAN. Any port can be configured as either **tagging** or **untagging**:

- The untagging feature of IEEE 802.1Q VLAN allows VLAN to work with legacy switches that don't recognize VLAN tags in packet headers.
- The tagging feature allows VLAN to span multiple 802.1Q-compliant switches through a single physical connection and allows Spanning Tree to be enabled on all ports and work normally.

Some relevant terms:

- **Tagging** - The act of putting 802.1Q VLAN information into the header of a packet.
- **Untagging** - The act of stripping 802.1Q VLAN information out of the packet header.

■ 802.1Q VLAN Tags

The figure below shows the 802.1Q VLAN tag. There are four additional octets inserted after the source MAC address. Their presence is indicated by a value of **0x8100** in the Ether Type field. When a packet's Ether Type field is equal to 0x8100, the packet carries the IEEE 802.1Q/802.1p tag. The tag is contained in the following two octets and consists of 3 bits of user priority, 1 bit of Canonical Format Identifier (CFI - used for encapsulating Token Ring packets so they can be carried across Ethernet backbones), and 12 bits of **VLAN ID (VID)**. The 3 bits of user priority are used by 802.1p. The VID is the VLAN identifier and is used by the 802.1Q standard. Because the VID is 12 bits long, 4094 unique VLAN can be identified.

The tag is inserted into the packet header making the entire packet longer by 4 octets. All of the information originally contained in the packet is retained.

802.1Q Tag

The Ether Type and VLAN ID are inserted after the MAC source address, but before the original Ether Type/Length or Logical Link Control. Because the packet is now a bit longer than it was originally, the Cyclic Redundancy Check (CRC) must be recalculated.

Adding an IEEE802.1Q Tag

■ Port VLAN ID

Packets that are tagged (are carrying the 802.1Q VID information) can be transmitted from one 802.1Q compliant network device to another with the VLAN information intact. This allows 802.1Q VLAN to span network devices (and indeed, the entire network – if all network devices are 802.1Q compliant).

Every physical port on a switch has a PVID. 802.1Q ports are also assigned a PVID, for use within the switch. If no VLAN are defined on the switch, all ports are then assigned to a default VLAN with a PVID equal to 1. Untagged packets are assigned the PVID of the port on which they were received. Forwarding decisions are based upon this PVID, in so far as VLAN are concerned. Tagged packets are forwarded according to the VID contained within the tag. Tagged packets are also assigned a PVID, but the PVID is not used to make packet forwarding decisions, the VID is.

Tag-aware switches must keep a table to relate PVID within the switch to VID on the network. The switch will compare the VID of a packet to be transmitted to the VID of the port that is to transmit the packet. If the two VIDs are different, the switch will drop the packet. Because of the existence of the PVID for untagged packets and the VID for tagged packets, tag-aware and tag-unaware network devices can coexist on the same network.

A switch port can have only one PVID, but can have as many VIDs as the switch has memory in its VLAN table to store them.

Because some devices on a network may be tag-unaware, a decision must be made at each port on a tag-aware device before packets are transmitted – should the packet to be transmitted have a tag or not? If the transmitting port is connected to a tag-unaware device, the packet should be untagged. If the transmitting port is connected to a tag-aware device, the packet should be tagged.

■ Default VLANs

The Switch initially configures one VLAN, VID = 1, called "**default**." The factory default setting assigns all ports on the Switch to the "**default**". As new VLANs are configured in Port-based mode, their respective member ports are removed from the "**default**."

■ Assigning Ports to VLANs

Before enabling VLANs for the switch, you must first assign each port to the VLAN group(s) in which it will participate. By default all ports are assigned to VLAN 1 as untagged ports. Add a port as a tagged port if you want it to carry traffic for one or more VLANs, and any intermediate network devices or the host at the other end of the connection supports VLANs. Then assign ports on the other VLAN-aware network devices along the path that will carry this traffic to the same VLAN(s), either manually or dynamically using GVRP. However, if you want a port on this switch to participate in one or more VLANs, but none of the intermediate network devices nor the host at the other end of the connection supports VLANs, then you should add this port to the VLAN as an untagged port.

VLAN-tagged frames can pass through VLAN-aware or VLAN-unaware network interconnection devices, but the VLAN tags should be stripped off before passing it on to any end-node host that does not support VLAN tagging.

■ VLAN Classification

When the switch receives a frame, it classifies the frame in one of two ways. If the frame is untagged, the switch assigns the frame to an associated VLAN (based on the default VLAN ID of the receiving port). But if the frame is tagged, the switch uses the tagged VLAN ID to identify the port broadcast domain of the frame.

■ Port Overlapping

Port overlapping can be used to allow access to commonly shared network resources among different VLAN groups, such as file servers or printers. Note that if you implement VLANs which do not overlap, but still need to communicate, you can connect them by enabled routing on this switch.

■ Untagged VLANs

Untagged (or static) VLANs are typically used to reduce broadcast traffic and to increase security. A group of network users assigned to a VLAN form a broadcast domain that is separate from other VLANs configured on the switch. Packets are forwarded only between ports that are designated for the same VLAN. Untagged VLANs can be used to manually isolate user groups or subnets.

4.5.3 Management VLAN

Configure Management VLAN on this page. The screens in [Figure 4-5-1](#) and [Figure 4-5-2](#) appear.

| Management VLAN Setting | |
|--------------------------------------|---|
| Management VLAN | default(1) <input type="button" value="▼"/> |

The page includes the following fields:

| Object | Description |
|--------------------|--------------------------------------|
| • VLAN ID | Displays the current VLAN ID entry. |
| • VLAN Name | Displays the current VLAN ID name. |
| • VLAN Type | Displays the current VLAN ID type. |
| • Modify | Click to modify VLAN configuration. |

4.5.5 Interface Settings

This page is used for configuring the Industrial Managed Switch port VLAN. The VLAN per Port Configuration page contains fields for managing ports that are part of a VLAN. The port **default VLAN ID (PVID)** is configured on the VLAN Port Configuration page. All untagged packets arriving to the device are tagged by the PVID.

Understanding nomenclature of the Switch

■ IEEE 802.1Q Tagged and Untagged

Every port on an 802.1Q compliant switch can be configured as tagged or untagged.

- **Tagged:** Ports with tagging enabled will put the VID number, priority and other VLAN information into the header of all packets that flow into those ports. If a packet has previously been tagged, the port will not alter the packet, thus keeping the VLAN information intact. The VLAN information in the tag can then be used by other 802.1Q compliant devices on the network to make packet-forwarding decisions.
- **Untagged:** Ports with untagging enabled will strip the 802.1Q tag from all packets that flow into those ports. If the packet doesn't have an 802.1Q VLAN tag, the port will not alter the packet. Thus, all packets received by and forwarded by an untagging port will have no 802.1Q VLAN information. (Remember that the PVID is only used internally within the Switch). Untagging is used to send packets from an 802.1Q-compliant network device to a non-compliant network device.

| Frame Income Frame Leave | Income Frame is tagged | Income Frame is untagged |
|-----------------------------|-------------------------------|---------------------------------|
| Leave port is tagged | Frame remains tagged | Tag is inserted |
| Leave port is untagged | Tag is removed | Frame remain untagged |

Table 4-5-1: Ingress/Egress Port with VLAN VID Tag/Untag Table

■ IEEE 802.1Q Tunneling (Q-in-Q)

IEEE 802.1Q Tunneling (QinQ) is designed for service providers carrying traffic for multiple customers across their networks. QinQ tunneling is used to maintain customer-specific VLAN and Layer 2 protocol configurations even when different customers use the same internal VLAN IDs. This is accomplished by inserting **Service Provider VLAN (SPVLAN)** tags into the customer's frames when they enter the service provider's network, and then stripping the tags when the frames leave the network.

A service provider's customers may have specific requirements for their internal VLAN IDs and number of VLANs supported. VLAN ranges required by different customers in the same service-provider network might easily overlap, and traffic passing through the infrastructure might be mixed. Assigning a unique range of VLAN IDs to each customer would restrict customer configurations, require intensive processing of VLAN mapping tables, and could easily exceed the maximum VLAN limit of 4096.

The Industrial Managed Switch supports multiple VLAN tags and can therefore be used in MAN applications as a provider bridge, aggregating traffic from numerous independent customer LANs into the **MAN (Metro Access Network)** space. One of the purposes of the provider bridge is to recognize and use VLAN tags so that the VLANs in the MAN space can be used independent of the customers' VLANs. This is accomplished by adding a VLAN tag with a MAN-related VID for frames entering the MAN. When leaving the MAN, the tag is stripped and the original VLAN tag with the customer-related VID is again available.

This provides a tunneling mechanism to connect remote costumer VLANs through a common MAN space without interfering with the VLAN tags. All tags use EtherType **0x8100** or **0x88A8**, where 0x8100 is used for customer tags and 0x88A8 are used for service provider tags.

In cases where a given service VLAN only has two member ports on the switch, the learning can be disabled for the particular VLAN and can therefore rely on flooding as the forwarding mechanism between the two ports. This way, the MAC table requirements is reduced.

Edit Interface Setting

The Edit Interface Setting/Status screens in [Figure 4-5-5](#) and [Figure 4-5-6](#) appear.

| Edit Interface Setting | | | | | | |

The page includes the following fields:

| Object | Description |
|------------------------------|---|
| • Port | The switch port number of the logical port. |
| • Interface VLAN Mode | Displays the current interface VLAN mode. |
| • PVID | Displays the current PVID. |
| • Accepted Frame Type | Displays the current access frame type. |
| • Ingress Filtering | Displays the current ingress filtering. |
| • Uplink | Displays the current uplink mode. |
| • TPID | Displays the current TPID. |

4.5.6 Port to VLAN

Use the VLAN Static Table to configure port members for the selected VLAN index. This page allows you to add and delete port members of each VLAN. The screen in [Figure 4-5-7](#) appears.

▼ Port to VLAN Settings

| VLAN ID : | 1 | <input type="button" value="▼"/> | |
|-----------|---------------------|---|-------------------------------------|
| Port | Interface VLAN Mode | Membership | PVID |
| GE1 | Trunk | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged | <input checked="" type="checkbox"/> |
| GE2 | Trunk | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged | <input checked="" type="checkbox"/> |
| GE3 | Trunk | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged | <input checked="" type="checkbox"/> |
| GE4 | Trunk | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged | <input checked="" type="checkbox"/> |
| LAG5 | Trunk | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged | <input checked="" type="checkbox"/> |

| LAG8 | Trunk | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged | <input checked="" type="checkbox"/> |

Figure 4-5-7: Port to VLAN Setting Page Screenshot

The page includes the following fields:

| Object | Description | |
|------------------------------|--|--|
| • VLAN ID | Select VLAN ID for this drop-down list to assign VLAN membership. | |
| • Port | The switch port number of the logical port. | |
| • Interface VLAN Mode | Displays the current interface VLAN mode. | |
| • Membership | Select VLAN membership for each interface by marking the appropriate radio button for a port or trunk: Forbidden: Interface is forbidden from automatically joining the VLAN via GVRP. Excluded: Interface is not a member of the VLAN. Packets associated with this VLAN will not be transmitted by the interface. Tagged: Interface is a member of the VLAN. All packets transmitted by the port will be tagged, that is, carry a tag and therefore carry VLAN or CoS information. Untagged: Interface is a member of the VLAN. All packets transmitted by the port will be untagged, that is, not carry a tag and therefore not carry VLAN or CoS information. Note that an interface must be | |

| | | |
|---------------|--|---|
| | | assigned to at least one group as an untagged port. |
| • PVID | | Displays the current PVID. |

Figure 4-5-8: Port VLAN Membership Table Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------------|--|
| • Port | The switch port number of the logical port. |
| • Mode | Displays the current VLAN mode. |
| • Administrative VLANs | Displays the current administrative VLANs. |
| • Operational VLANs | Displays the current operational VLANs. |
| • Modify | Click Edit to modify VLAN membership. |

4.5.8 Protocol VLAN Group Setting

The network devices required to support multiple protocols cannot be easily grouped into a common VLAN. This may require non-standard devices to pass traffic between different VLANs in order to encompass all the devices participating in a specific protocol. This kind of configuration deprives users of the basic benefits of VLANs, including security and easy accessibility.

To avoid these problems, you can configure this Industrial Managed Switch with protocol-based VLANs that divide the physical network into logical VLAN groups for each required protocol. When a frame is received at a port, its VLAN membership can then be determined based on the protocol type being used by the inbound packets.

Command Usage

To configure protocol-based VLANs, follow these steps:

1. First configure **VLAN groups for the protocols** you want to use. Although not mandatory, we suggest configuring a separate VLAN for each major protocol running on your network. Do not add port members at this time.
2. Create a **protocol group** for each of the protocols you want to assign to a VLAN using the Protocol VLAN Configuration page.
3. Then map the protocol for each interface to the appropriate VLAN using the Protocol VLAN Port Configuration page.

This page allows you to configure protocol-based VLAN Group Setting. The protocol-based VLAN screens in [Figure 4-5-9](#) and [Figure 4-5-10](#) appear.

| Add Protocol VLAN Group | |
|--|---|
| Group ID (1-8) | <input type="text" value="1"/> |
| Frame Type | <input style="width: 150px; height: 25px; border: 1px solid #ccc; padding: 2px 10px;" type="button" value="Ethernet_II"/> |
| Protocol Value (0x0600-0xFFFF) | <input type="text"/> |
| <input style="width: 100px; height: 30px; border: 1px solid #ccc; background-color: #e0f2ff; border-radius: 5px; padding: 5px 10px;" type="button" value="Add"/> | |

| • VLAN ID | Displays the current VLAN ID. |
| • Delete | Click  to delete the group ID entry. |

4.5.10 GVRP Setting

GARP VLAN Registration Protocol (GVRP) defines a way for switches to exchange VLAN information in order to register VLAN members on ports across the network.

VLANs are **dynamically** configured based on **join messages** issued by host devices and propagated throughout the network.

GVRP must be enabled to permit automatic VLAN registration, and to support VLANs which extend beyond the local switch.

The GVRP Global Setting/Information screens in [Figure 4-5-13](#) and [Figure 4-5-14](#) appear.

Figure 4-5-13: GVRP Global Setting Page Screenshot

Buttons

Apply : Click to apply changes.

| ▼ GVRP Informations | |
|---------------------|-------------------|
| Information Name | Information Value |
| GVRP Status | Disabled |
| Join Timeout | 200 millisecond |
| Leave Timeout | 600 millisecond |
| LeaveAll Timeout | 10000 millisecond |

Figure 4-5-14: GVRP Global Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------------------|--|
| • GVRP Status | Displays the current GVRP status. |
| • Join Timeout | Displays the current join timeout parameter. |
| • Leave Timeout | Displays the current leave timeout parameter. |
| • LeaveAll Timeout | Displays the current leaveall timeout parameter. |

4.5.11 GVRP Port Setting

The GVRP Port Setting/Status screens in [Figure 4-5-15](#) and [Figure 4-5-16](#) appear.

| Port settings | | | |
|--------------------------------------|---|-------------------|---|
| Port Select | GVRP Enabled | Registration Mode | Vlan Creation |
| Select Ports | <input checked="" type="radio"/> Enabled <input type="radio"/> Disabled | Normal | <input checked="" type="radio"/> Enabled <input type="radio"/> Disabled |
| <input type="button" value="Apply"/> | | | |

Figure 4-5-15: GVRP Global Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------------|---|
| • Port Select | Select port for this drop-down list to assign protocol VLAN port. |
| • GVRP Enabled | Controls whether GVRP is enabled or disabled on port. |
| • Registration Mode | By default GVRP ports are in normal registration mode. These ports use GVRP join messages from neighboring switches to prune the VLANs running across the 802.1Q trunk link. If the device on the other side is not capable of sending GVRP messages, or if you do not want to allow the switch to prune any of the VLANs, use the fixed mode. Fixed mode ports will forward for all VLANs that exist in the switch database. Ports in forbidden mode forward only for VLAN 1. |
| • VLAN Creation | GVRP can dynamically create VLANs on switches for trunking purposes. By enabling GVRP dynamic VLAN creation, a switch will add VLANs to its database when it receives GVRP join messages about VLANs it does not have. |

Buttons

: Click to apply changes.

| ▼ GVRP Port Status | | | |
|--------------------|--------------|-------------------|---------------------|
| Port | Enable State | Registration Mode | Vlan Creation State |
| GE1 | Disabled | Normal | Enabled |
| GE2 | Disabled | Normal | Enabled |
| GE3 | Disabled | Normal | Enabled |

4.5.14 VLAN Setting Example:

- Separate VLANs
- 802.1Q VLAN Trunk

4.5.14.1 Two Separate 802.1Q VLANs

The diagram shows how the Industrial Managed Switch handles Tagged and Untagged traffic flow for two VLANs. VLAN Group 2 and VLAN Group 3 are separated VLANs. Each VLAN isolates network traffic so only members of the VLAN receive traffic from the same VLAN members. The screen in [Figure 4-5-20](#) appears and [Table 4-5-2](#) describes the port configuration of the Industrial Managed Switches.

Figure 4-5-20: Two Separate VLAN Diagrams

| VLAN Group | VID | Untagged Members | Tagged Members |
|--------------|-----|------------------|----------------|
| VLAN Group 1 | 1 | Port-7~Port-8 | N/A |
| VLAN Group 2 | 2 | Port-1,Port-2 | Port-3 |
| VLAN Group 3 | 3 | Port-4,Port-5 | Port-6 |

Table 4-5-2: VLAN and Port Configuration

The scenario is described as follows:

■ Untagged packet entering VLAN 2

1. While [PC-1] transmits an **untagged** packet entering **Port-1**, the Industrial Managed Switch will tag it with a **VLAN Tag=2**. [PC-2] and [PC-3] will receive the packet through **Port-2** and **Port-3**.
2. [PC-4], [PC-5] and [PC-6] receive no packet.
3. While the packet leaves **Port-2**, it will be stripped away its tag becoming an **untagged** packet.
4. While the packet leaves **Port-3**, it will keep as a **tagged** packet with **VLAN Tag=2**.

■ Tagged packet entering VLAN 2

1. While [PC-3] transmits a **tagged** packet with **VLAN Tag=2** entering **Port-3**. [PC-1] and [PC-2] will receive the packet through **Port-1** and **Port-2**.
2. While the packet leaves **Port-1** and **Port-2**, it will be stripped away its tag becoming an **untagged** packet.

■ Untagged packet entering VLAN 3

1. While [PC-4] transmits an **untagged** packet entering **Port-4**, the switch will tag it with a **VLAN Tag=3**. [PC-5] and [PC-6] will receive the packet through **Port-5** and **Port-6**.
2. While the packet leaves **Port-5**, it will be stripped away its tag becoming an **untagged** packet.
3. While the packet leaves **Port-6**, it will keep as a **tagged** packet with **VLAN Tag=3**.

In this example, VLAN Group 1 is set as default VLAN, but only focuses on VLAN 2 and VLAN 3 traffic flow.

Setup Steps

1. Create VLAN Group 2 and 3

Add VLAN group 2 and group 3

| ▼ VLAN Table | | | | |
|--------------|-----------|---|-----------|------|
| FIRST | PREV | 1 | NEXT | LAST |
| VLAN ID | VLAN Name | | VLAN Type | |
| 1 | default | | Default | |
| 2 | 20002 | | Static | |
| 3 | 30003 | | Static | |

2. Assign VLAN mode and PVID to each port:

Port-1,Port-2 and Port-3 : VLAN Mode = Hybrid, PVID=2

Port-4,Port-5 and Port-6 : VLAN Mode = Hybrid, PVID=3

▼ Port VLAN Status

| Port | Interface VLAN Mode | PVID | Accept Frame Type |
|------|---------------------|------|-------------------|
| GE1 | Hybrid | 2 | ALL |
| GE2 | Hybrid | 2 | ALL |
| GE3 | Hybrid | 2 | ALL |
| GE4 | Hybrid | 3 | ALL |
| GE5 | Hybrid | 3 | ALL |
| GE6 | Hybrid | 3 | ALL |

3. Assign Tagged/Untagged to each port:

VLAN ID = 2:

Port-1 & 2 = Untagged,

Port-3 = Tagged,

Port -4~6 = Excluded.

▼ Port to VLAN Settings

VLAN ID : 2

| Port | Interface VLAN Mode | Membership | PVID |
|------|---------------------|---|-------------------------------------|
| GE1 | Hybrid | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged | <input checked="" type="checkbox"/> |
| GE2 | Hybrid | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged | <input checked="" type="checkbox"/> |
| GE3 | Hybrid | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input checked="" type="radio"/> Tagged <input type="radio"/> Untagged | <input checked="" type="checkbox"/> |
| GE4 | Hybrid | <input type="radio"/> Forbidden <input checked="" type="radio"/> Excluded <input type="radio"/> Tagged <input type="radio"/> Untagged | <input type="checkbox"/> |

| GE6 | Hybrid | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input checked="" type="radio"/> Tagged <input type="radio"/> Untagged | <input checked="" type="checkbox"/> |

4.5.14.2 VLAN Trunking between two 802.1Q aware switches

In most cases, they are used for “Uplink” to other switches. VLANs are separated at different switches, but they need to access other switches within the same VLAN group. The screens in following appear.

Setup steps

1. Create VLAN Group 2 and 3

Add VLAN group 2 and group 3

| VLAN Table | | | | |
|----------------|---------|---|------------------|---------|
| FIRST | PREV | 1 | NEXT | LAST |
| VLAN ID | | | VLAN Name | |
| 1 | default | | | Default |
| 2 | 20002 | | | Static |
| 3 | 30003 | | | Static |

2. Assign VLAN mode and PVID to each port:

Port-1, Port-2 and Port-3 : VLAN Mode = Hybrid, PVID=2

Port-4, Port-5 and Port-6 : VLAN Mode = Hybrid, PVID=3

Port-7 : VLAN Mode = Hybrid, PVID=1

| Port | Interface VLAN Mode | PVID | Accept Frame Type |
|------|---------------------|------|-------------------|
| GE1 | Hybrid | 2 | ALL |
| GE2 | Hybrid | 2 | ALL |
| GE3 | Hybrid | 2 | ALL |
| GE4 | Hybrid | 3 | ALL |
| GE5 | Hybrid | 3 | ALL |
| GE6 | Hybrid | 3 | ALL |
| GE7 | Hybrid | 1 | ALL |

3. Assign Tagged/Untagged to each port:

VLAN ID = 1:

Port-1~6 = Untagged,

Port -7 = Excluded.

| Port to VLAN Settings | | | |
|-----------------------|---------------------|---|-------------------------------------|
| Port | Interface VLAN Mode | Membership | PVID |
| GE1 | Hybrid | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged | <input type="checkbox"/> |
| GE2 | Hybrid | <input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged | <input type="checkbox"/> |

4.6 Spanning Tree Protocol

4.6.1 Theory

The Spanning Tree Protocol can be used to detect and disable network loops, and to provide backup links between switches, bridges or routers. This allows the switch to interact with other bridging devices in your network to ensure that only one route exists between any two stations on the network, and provide backup links which automatically take over when a primary link goes down. The spanning tree algorithms supported by this switch include these versions:

- **STP – Spanning Tree Protocol (IEEE 802.1D)**
- **RSTP – Rapid Spanning Tree Protocol (IEEE 802.1w)**
- **MSTP – Multiple Spanning Tree Protocol (IEEE 802.1s)**

The **IEEE 802.1D Spanning Tree Protocol** and **IEEE 802.1w Rapid Spanning Tree Protocol** allow for the blocking of links between switches that form loops within the network. When multiple links between switches are detected, a primary link is established. Duplicated links are blocked from use and become standby links. The protocol allows for the duplicate links to be used in the event of a failure of the primary link. Once the Spanning Tree Protocol is configured and enabled, primary links are established and duplicated links are blocked automatically. The reactivation of the blocked links (at the time of a primary link failure) is also accomplished automatically without operator intervention.

This automatic network reconfiguration provides maximum uptime to network users. However, the concepts of the Spanning Tree Algorithm and protocol are a complicated and complex subject and must be fully researched and understood. It is possible to cause serious degradation of the performance of the network if the Spanning Tree is incorrectly configured. Please read the following before making any changes from the default values.

The Switch STP performs the following functions:

- Creates a single spanning tree from any combination of switching or bridging elements.
- Creates multiple spanning trees – from any combination of ports contained within a single switch, in user specified groups.
- Automatically reconfigures the spanning tree to compensate for the failure, addition, or removal of any element in the tree.
- Reconfigures the spanning tree without operator intervention.

Bridge Protocol Data Units

For STP to arrive at a stable network topology, the following information is used:

- The unique switch identifier
- The path cost to the root associated with each switch port
- The port identifier

STP communicates between switches on the network using Bridge Protocol Data Units (BPDUs). Each BPDU contains the following information:

- The unique identifier of the switch that the transmitting switch currently believes is the root switch
- The path cost to the root from the transmitting port

- The port identifier of the transmitting port

The switch sends BPDUs to communicate and construct the spanning-tree topology. All switches connected to the LAN on which the packet is transmitted will receive the BPDU. BPDUs are not directly forwarded by the switch, but the receiving switch uses the information in the frame to calculate a BPDU, and, if the topology changes, initiates a BPDU transmission.

The communication between switches via BPDUs results in the following:

- One switch is elected as the root switch
- The shortest distance to the root switch is calculated for each switch
- A designated switch is selected. This is the switch closest to the root switch through which packets will be forwarded to the root.
- A port for each switch is selected. This is the port providing the best path from the switch to the root switch.
- Ports included in the STP are selected.

Creating a Stable STP Topology

It is to make the root port a fastest link. If all switches have STP enabled with default settings, the switch with the lowest MAC address in the network will become the root switch. By increasing the priority (lowering the priority number) of the best switch, STP can be forced to select the best switch as the root switch.

When STP is enabled using the default parameters, the path between source and destination stations in a switched network might not be ideal. For instance, connecting higher-speed links to a port that has a higher number than the current root port can cause a root-port change.

STP Port States

The BPDUs take some time to pass through a network. This propagation delay can result in topology changes where a port that transitioned directly from a Blocking state to a Forwarding state could create temporary data loops. Ports must wait for new network topology information to propagate throughout the network before starting to forward packets. They must also wait for the packet lifetime to expire for BPDU packets that were forwarded based on the old topology. The forward delay timer is used to allow the network topology to stabilize after a topology change. In addition, STP specifies a series of states a port must transition through to further ensure that a stable network topology is created after a topology change.

Each port on a switch using STP exists in one of the following five states:

- **Blocking** – the port is blocked from forwarding or receiving packets
- **Listening** – the port is waiting to receive BPDU packets that may tell the port to go back to the blocking state
- **Learning** – the port is adding addresses to its forwarding database, but not yet forwarding packets
- **Forwarding** – the port is forwarding packets
- **Disabled** – the port only responds to network management messages and must return to the blocking state first

A port transitions from one state to another shown below:

- From initialization (switch boot) to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled

- From disabled to blocking

Figure 4-6-1: STP Port State Transitions

You can modify each port state by using management software. When you enable STP, every port on every switch in the network goes through the blocking state and then transitions through the states of listening and learning at power up. If properly configured, each port stabilizes to the forwarding or blocking state. No packets (except BPDUs) are forwarded from, or received by, STP enabled ports until the forwarding state is enabled for that port.

2. STP Parameters

STP Operation Levels

The Switch allows for two levels of operation: the switch level and the port level. The switch level forms a spanning tree consisting of links between one or more switches. The port level constructs a spanning tree consisting of groups of one or more ports. The STP operates in much the same way for both levels.

On the switch level, STP calculates the Bridge Identifier for each switch and then sets the Root Bridge and the Designated Bridges. On the port level, STP sets the Root Port and the Designated Ports.

The following are the user-configurable STP parameters for the switch level:

| Parameter | Description | Default Value |
|---|--|---------------|
| Bridge Identifier(Not user configurable) | A combination of the User-set priority and the switch's MAC address. | 32768 + MAC |

| | | |
|--|--|------------|
| except by setting priority below) | The Bridge Identifier consists of two parts: a 16-bit priority and a 48-bit Ethernet MAC address 32768 + MAC | |
| Priority | A relative priority for each switch – lower numbers give a higher priority and a greater chance of a given switch being elected as the root bridge | 32768 |
| Hello Time | The length of time between broadcasts of the hello message by the switch | 2 seconds |
| Maximum Age Timer | Measures the age of a received BPDU for a port and ensures that the BPDU is discarded when its age exceeds the value of the maximum age timer. | 20 seconds |
| Forward Delay Timer | The amount time spent by a port in the learning and listening states waiting for a BPDU that may return the port to the blocking state. | 15 seconds |

The following are the user-configurable STP parameters for the port or port group level:

| Variable | Description | Default Value |
|----------------------|---|---|
| Port Priority | A relative priority for each port –lower numbers give a higher priority and a greater chance of a given port being elected as the root port | 128 |
| Port Cost | A value used by STP to evaluate paths – STP calculates path costs and selects the path with the minimum cost as the active path | 200,000-100Mbps Fast Ethernet ports 20,000-1000Mbps Gigabit Ethernet ports 0 - Auto |

Default Spanning-Tree Configuration

| Feature | Default Value |
|-----------------|----------------------------|
| Enable state | STP disabled for all ports |
| Port priority | 128 |
| Port cost | 0 |
| Bridge Priority | 32,768 |

User-Changeable STA Parameters

The Switch's factory default setting should cover the majority of installations. However, it is advisable to keep the default settings as set at the factory; unless, it is absolutely necessary. The user changeable parameters in the Switch are as follows:

Priority – A Priority for the switch can be set from 0 to 65535. 0 is equal to the highest Priority.

Hello Time – The Hello Time can be from 1 to 10 seconds. This is the interval between two transmissions of BPDU packets sent by the Root Bridge to tell all other Switches that it is indeed the Root Bridge. If you set a Hello Time for your Switch, and it is not the Root Bridge, the set Hello Time will be used if and when your Switch becomes the Root Bridge.

The Hello Time cannot be longer than the Max. Age. Otherwise, a configuration error will occur.

Max. Age – The Max Age can be from 6 to 40 seconds. At the end of the Max Age, if a BPDU has still not been received from the Root Bridge, your Switch will start sending its own BPDU to all other Switches for permission to become the Root Bridge. If it turns out that your Switch has the lowest Bridge Identifier, it will become the Root Bridge.

Forward Delay Timer – The Forward Delay can be from 4 to 30 seconds. This is the time any port on the Switch spends in the listening state while moving from the blocking state to the forwarding state.

Observe the following formulas when setting the above parameters:

Max. Age = 2 x (Forward Delay - 1 second)

Max. Age = 2 x (Hello Time + 1 second)

Port Priority – A Port Priority can be from 0 to 240. The lower the number, the greater the probability the port will be chosen as the Root Port.

Port Cost – A Port Cost can be set from 0 to 200000000. The lower the number, the greater the probability the port will be chosen to forward packets.

3. Illustration of STP

A simple illustration of three switches connected in a loop is depicted in the below diagram. In this example, you can anticipate some major network problems if the STP assistance is not applied.

If switch A broadcasts a packet to switch B, switch B will broadcast it to switch C, and switch C will broadcast it back to switch A and so on. The broadcast packet will be passed indefinitely in a loop, potentially causing a network failure. In this example, STP breaks the loop by blocking the connection between switch B and C. The decision to block a particular connection is based on the STP calculation of the most current Bridge and Port settings.

Now, if switch A broadcasts a packet to switch C, then switch C will drop the packet at port 2 and the broadcast will end there. Setting-up STP using values other than the defaults, can be complex. Therefore, you are advised to keep the default factory settings and STP will automatically assign root bridges/ports and block loop connections. Influencing STP to choose a particular switch as the root bridge using the Priority setting, or influencing STP to choose a particular port to block using the Port Priority and Port Cost settings is, however, relatively straight forward.

Figure 4-6-2: Before Applying the STA Rules

In this example, only the default STP values are used.

Figure 4-6-3: After Applying the STA Rules

The switch with the lowest Bridge ID (switch C) was elected the root bridge, and the ports were selected to give a high port cost between switches B and C. The two (optional) Gigabit ports (default port cost = 20,000) on switch A are connected to one (optional) Gigabit port on both switch B and C. The redundant link between switch B and C is deliberately chosen as a 100 Mbps Fast Ethernet link (default port cost = 200,000). Gigabit ports could be used, but the port cost should be increased from the default to ensure that the link between switch B and switch C is the blocked link.

This section has the following items:

- **STP Global Setting** Configures STP system settings
- **STP Port Setting** Configuration per port STP setting
- **CIST Instance Setting** Configures system configuration
- **CIST Port Setting** Configures CIST port setting
- **MST Instance Setting** Configuration each MST instance setting
- **MST Port Setting** Configuration per port MST setting
- **STP Statistics** Displays the STP statistics

4.6.2 STP Global Settings

This page allows you to configure STP system settings. The settings are used by all STP Bridge instances in the Switch. The Industrial Managed Switch support the following Spanning Tree protocols:

- **Compatible -- Spanning Tree Protocol (STP):** Provides a single path between end stations, avoiding and eliminating loops.
- **Normal -- Rapid Spanning Tree Protocol (RSTP):** Detects and uses of network topologies that provide faster spanning tree convergence, without creating forwarding loops.
- **Extension – Multiple Spanning Tree Protocol (MSTP):** Defines an extension to RSTP to further develop the usefulness of virtual LANs (VLANs). This "Per-VLAN" Multiple Spanning Tree Protocol configures a separate Spanning Tree for each VLAN group and blocks all but one of the possible alternate paths within each Spanning Tree.

The STP Global Settings screens in [Figure 4-6-4](#) and [Figure 4-6-5](#) appear.

| Global Setting | |
|--------------------------------------|---|
| Enabled | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| BPDU Forward | <input checked="" type="radio"/> flooding <input type="radio"/> filtering |
| PathCost Method | <input type="radio"/> short <input checked="" type="radio"/> long |
| Force Version | RSTP-Operation |
| Configuration Name | 00:00:30:4F:11:22 (Max.32 charactor) |
| Configuration Revision | 0 (0 - 65535) |
| <input type="button" value="Apply"/> | |

Figure 4-6-4: Global Settings Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------------------|--|
| • Enable | Enable or disable the STP function. The default value is "Disabled". |
| • BPDU Forward | Set the BPDU forward method. |
| • PathCost Method | The path cost method is used to determine the best path between devices. Therefore, lower values should be assigned to ports attached to faster media, and higher values assigned to ports with slower media. |
| • Force Version | The STP protocol version setting. Valid values are STP-Compatible , RSTP-Operation and MSTP-Operation . |
| • Configuration Name | Identifier used to identify the configuration currently being used. |

| • Force Version | Displays the current force version. |
| • Configuration Name | Displays the current configuration name. |
| • Configuration Revision | Display the current configuration revision. |

4.6.3 STP Port Setting

This page allows you to configure per port STP settings. The STP Port Setting screens in [Figure 4-6-6](#) and [Figure 4-6-7](#) appear.

| STP Port Setting | | | | | | |
|---|----------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|--------------------------------------|--------------------------|
| Port Select | External Path Cost (0 = Auto) | Edge Port | BPDUs Filter | BPDU Guard | P2P MAC | Migrate |
| Select Ports <input type="button" value="▼"/> | 0 <input type="text"/> | No <input type="button" value="▼"/> | No <input type="button" value="▼"/> | No <input type="button" value="▼"/> | Yes <input type="button" value="▼"/> | <input type="checkbox"/> |
| <input type="button" value="Apply"/> | | | | | | |

Figure 4-6-6: STP Port Configuration Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------------------------|---|
| • Port Select | Select port number for this drop down list. |
| • External Cost (0 = Auto) | Controls the path cost incurred by the port. The Auto setting will set the path cost as appropriate by the physical link speed, using the 802.1D recommended values. Using the Specific setting, a user-defined value can be entered. The path cost is used when establishing the active topology of the network. Lower path cost ports are chosen as forwarding ports in favor of higher path cost ports. Valid values are in the range 1 to 200000000. |
| • Edge Port | Controls whether the operEdge flag should start as being set or cleared. (The initial operEdge state when a port is initialized). |
| • BPDU Filter | Control whether a port explicitly configured as Edge will transmit and receive BPDUs. |
| • BPDU Guard | Control whether a port explicitly configured as Edge will disable itself upon reception of a BPDU. The port will enter the error-disabled state, and will be removed from the active topology. |
| • P2P MAC | Controls whether the port connects to a point-to-point LAN rather than a shared medium. This can be automatically determined, or forced either true or false. Transition to the forwarding state is faster for point-to-point LANs than for shared media. (This applies to physical ports only. Aggregations are always forced Point2Point). |
| • Migrate | If at any time the switch detects STP BPDUs, including Configuration or Topology Change Notification BPDUs, it will automatically set the selected interface to forced STP-compatible mode. However, you can also use the Protocol Migration button to manually re-check the appropriate BPDU format (RSTP or STP-compatible) to send on the selected |

| | |
|--|---|
| | interfaces. (Default: Disabled). |
|--|---|

Buttons
Apply

: Click to apply changes.

By default, the system automatically detects the speed and duplex mode used on each port, and configures the path cost according to the values shown below. Path cost "0" is used to indicate auto-configuration mode. When the short path cost method is selected and the default path cost recommended by the IEEE 8021w standard exceeds 65,535, the default is set to 65,535.

| Port Type | IEEE 802.1D-1998 | IEEE 802.1w-2001 |
|-------------------------|------------------|--------------------|
| Ethernet | 50-600 | 200,000-20,000,000 |

| • P2P MAC | Displays the current P2P MAC status. |

4.6.4 CIST Instance Setting

This page allows you to configure CIST instance settings. The CIST Instance Setting and Information screens in [Figure 4-6-8](#) & [Figure 4-6-9](#) appear.

| CIST Instance Setting | |
|--------------------------------------|-----------|
| Priority | 32768 |
| Max Hops | 20 (1-40) |
| Forward Delay | 15 (4-30) |
| Max Age | 20 (6-40) |
| Tx Hold Count | 6 (1-10) |
| Hello Time | 2 (1-10) |
| <input type="button" value="Apply"/> | |

Figure 4-6-8: CIST Instance Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|------------------------|--|
| • Priority | Controls the bridge priority. Lower numeric values have better priority. The bridge priority plus the MSTI instance number, concatenated with the 6-byte MAC address of the switch forms a Bridge Identifier. For MSTP operation, this is the priority of the CIST. Otherwise, this is the priority of the STP/RSTP bridge. |
| • Max Hops | This defines the initial value of remaining Hops for MSTI information generated at the boundary of an MSTI region. It defines how many bridges a root bridge can distribute its BPDU information. Valid values are in the range 6 to 40 hops. |
| • Forward Delay | The delay used by STP Bridges to transition Root and Designated Ports to Forwarding (used in STP compatible mode). Valid values are in the range 4 to 30 seconds -Default: 15. -Minimum: The higher of 4 or [(Max. Message Age / 2) + 1]. -Maximum: 30. |
| • Max Age | The maximum age of the information transmitted by the Bridge when it is the Root Bridge. Valid values are in the range 6 to 40 seconds. -Default: 20. -Minimum: The higher of 6 or [2 x (Hello Time + 1)]. -Maximum: The lower of 40 or [2 x (Forward Delay -1)]. |
| • Tx Hold Count | The number of BPDU's a bridge port can send per second. |

| | |
|---------------------|---|
| | When exceeded, transmission of the next BPDU will be delayed. Valid values are in the range 1 to 10 BPDU's per second. |
| • Hello Time | The time that controls the switch to send out the BPDU packet to check STP current status. Enter a value between 1 through 10. |

| • Regional Root Bridge | Displays the current regional root bridge. |
| • Internal Root Cost | Displays the current internal root cost. |
| • Designated Bridge | Displays the current designated bridge. |
| • Internal Port Path Cost | Displays the current internal port path cost. |
| • Edge Port Conf/Oper | Displays the current edge port conf/oper. |
| • P2P MAC Conf/Oper | Displays the current P2P MAC conf/oper. |
| • Port Role | Displays the current port role. |
| • Port State | Displays the current port state. |

4.6.6 MST Instance Configuration

This page allows the user to configure MST Instance Configuration. The MST Instance Setting, Information and Status screens in [Figure 4-6-12](#), [Figure 4-6-13](#) and [Figure 4-6-14](#) appear.

| MST Instance Setting | | |
|--|--------------------|----------|
| MSTI ID (1-15) | VLAN List (1-4094) | Priority |
| 1 | | 32768 |
| <input style="width: 100px; height: 30px; background-color: #0070C0; color: white; border: none; border-radius: 10px; font-weight: bold; font-size: 14px; padding: 5px; margin: auto;" type="button" value="Apply"/> | | |

Figure 4-6-12: MST Instance Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------------------|--|
| • MSTI ID | Allow to assign MSTI ID. The range for the MSTI ID is 1-15. |
| • VLAN List (1-4096) | Allow to assign VLAN list to special MSTI ID. The range for the VLAN list is 1-4094. |
| • Priority | Controls the bridge priority. Lower numerical values have better priority. The bridge priority plus the MSTI instance number, concatenated with the 6-byte MAC address of the switch forms a Bridge Identifier. |

| • Remaining Hops | Displays the current remaining hops. |
| • Last Topology Change | Display the current last topology change. |

4.6.7 MST Port Setting

This page allows the user to inspect the current STP MSTI port configurations, and possibly change them as well.

A MSTI port is a virtual port, which is instantiated separately for each active CIST (physical) port for each MSTI instance configured and applicable for the port. The MSTI instance must be selected before displaying actual MSTI port configuration options.

This page contains MSTI port settings for physical and aggregated ports. The aggregation settings are global. The MSTI Ports Setting screens in [Figure 4-6-15](#) and [Figure 4-6-16](#) appear.

| MST ID | Port Select | Priority | Internal Path Cost (0 = Auto) |
|--------|--------------|----------|----------------------------------|
| 1 | Select Ports | 128 | 0 |

Apply

Figure 4-6-15: MST Port Configuration Page Screenshot

The page includes the following fields:

| Object | Description |
|--|---|
| • MST ID | Enter the special MST ID to configure path cost & priority. |
| • Port Select | Select port number for this drop down list. |
| • Priority | Controls the port priority. This can be used to control priority of ports having identical port cost. |
| • Internal Path Cost (0 = Auto) | <p>Controls the path cost incurred by the port.</p> <p>The Auto setting will set the path cost as appropriate by the physical link speed, using the 802.1D recommended values. Using the Specific setting, a user-defined value can be entered.</p> <p>The path cost is used when establishing the active topology of the network. Lower path cost ports are chosen as forwarding ports in favor of higher path cost ports.</p> <p>Valid values are in the range 1 to 200000000.</p> |

The page includes the following fields:

| Object | Description |
|-----------------------------------|---|
| • Unknown Multicast Action | Displays the current unknown multicast action status. |
| • Forward Method For IPv4 | Displays the current IPv4 multicast forward method. |
| • Forward Method For IPv6 | Displays the current IPv6 multicast forward method. |

4.7.2 Multicast Throttling Setting

Multicast throttling sets a maximum number of multicast groups that a port can join at the same time. When the maximum number of groups is reached on a port, the switch can take one of two actions; either “deny” or “replace”. If the action is set to deny, any new multicast join reports will be dropped. If the action is set to replace, the switch randomly removes an existing group and replaces it with the new multicast group.

Once you have configured multicast profiles, you can assign them to interfaces on the Industrial Managed Switch. Also you can set the multicast throttling number to limit the number of multicast groups an interface can join at the same time. The MAX Group and Information screens in [Figure 4-7-3](#) and [Figure 4-7-4](#) appear.

Max Groups and Action Setting

| IP Type | Port Select | Max Groups | Action |
|---------|--------------|-------------|---|
| IPv4 | Select Ports | 256 (0-256) | <input checked="" type="radio"/> Deny <input type="radio"/> Replace |

Apply

Figure 4-7-3: Max Groups and Action Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------|---|
| • IP Type | Select IPv4 or IPv6 from this drop-down list. |
| • Port Select | Select port number from this drop-down list. |
| • Max Groups | Sets the maximum number of multicast groups an interface can join at the same time. Range: 0-256; Default: 256 |
| • Action | Sets the action to take when the maximum number of multicast groups for the interface has been exceeded. (Default: Deny) -Deny - The new multicast group join report is dropped. |

| | |
|--|--|
| | -Replace - The new multicast group replaces an existing group. |

4.7.3 Multicast Profile Setting

The Add Profile and Profile Status screens in [Figure 4-7-5](#) and [Figure 4-7-6](#) appear.

Add Profile

| | |
|---------------|--|
| IP Type | IPv4 |
| Profile Index | 1 (1-128) |
| Group From | <input type="text"/> |
| Group To | <input type="text"/> |
| Action | <input checked="" type="radio"/> Permit <input type="radio"/> Deny |
| Add | |

Figure 4-7-5: Add Profile Setting Page Screenshot

The page includes the following fields:

| Object | Description | |
|------------------------|---|--|
| • IP Type | Select IPv4 or IPv6 from this drop-down list. | |
| • Profile Index | Indicates the ID of this particular profile. | |
| • Group from | Specifies multicast groups to include in the profile. Specify a multicast group range by entering a start IP address. | |
| • Group to | Specifies multicast groups to include in the profile. Specify a multicast group range by entering an end IP address. | |
| • Action | Sets the access mode of the profile; either permit or deny . | |
| | - Permit | Multicast join reports are processed when a multicast group falls within the controlled range. |
| | - Deny | When the access mode is set to, multicast join reports are only processed when the multicast group is not in the controlled range. |

Buttons

: Click to add multicast profile entry.

Figure 4-7-6: IGMP/MLD Profile Status Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------------|---|
| • Index | Displays the current index. |
| • IP Type | Displays the current IP Type. |
| • Group from | Displays the current group from. |
| • Group to | Displays the current group to. |
| • Action | Displays the current action. |
| • Modify | Click  to edit parameter. Click  to delete the MLD/IGMP profile entry. |

4.8 IGMP Snooping

The **Internet Group Management Protocol (IGMP)** lets host and routers share information about multicast groups memberships. IGMP snooping is a switch feature that monitors the exchange of IGMP messages and copies them to the CPU for feature processing. The overall purpose of IGMP Snooping is to limit the forwarding of multicast frames to only ports that are a member of the multicast group.

About the Internet Group Management Protocol (IGMP) Snooping

Computers and network devices that want to receive multicast transmissions need to inform nearby routers that they will become members of a multicast group. The **Internet Group Management Protocol (IGMP)** is used to communicate this information. IGMP is also used to periodically check the multicast group for members that are no longer active. In the case where there is more than one multicast router on a sub network, one router is elected as the 'queried'. This router then keeps track of the membership of the multicast groups that have active members. The information received from IGMP is then used to determine if multicast packets should be forwarded to a given sub network or not. The router can check, using IGMP, to see if there is at least one member of a multicast group on a given subnet work. If there are no members on a sub network, packets will not be forwarded to that sub network.

Figure 4-8-1: Multicast Service

Figure 4-8-2: Multicast Flooding

Figure 4-8-3: IGMP Snooping Multicast Stream Control

IGMP Versions 1 and 2

Multicast groups allow members to join or leave at any time. IGMP provides the method for members and multicast routers to communicate when joining or leaving a multicast group.

IGMP version 1 is defined in RFC 1112. It has a fixed packet size and no optional data.

The format of an IGMP packet is shown below:

IGMP Message Format

Octets

0

8

16

31

| Type | Response Time | Checksum |
|------|---------------|----------|
|------|---------------|----------|

Group Address (all zeros if this is a query)

The IGMP Type codes are shown below:

| Type | Meaning |
|-------------|---|
| 0x11 | Membership Query (if Group Address is 0.0.0.0) |
| 0x11 | Specific Group Membership Query (if Group Address is Present) |
| 0x16 | Membership Report (version 2) |
| 0x17 | Leave a Group (version 2) |
| 0x12 | Membership Report (version 1) |

IGMP packets enable multicast routers to keep track of the membership of multicast groups, on their respective sub networks.

The following outlines what is communicated between a multicast router and a multicast group member using IGMP.

A host sends an IGMP “**report**” to join a group

A host will never send a report when it wants to leave a group (for version 1).

A host will send a “**leave**” report when it wants to leave a group (for version 2).

Multicast routers send IGMP queries (to the all-hosts group address: 224.0.0.1) periodically to see whether any group members exist on their sub networks. If there is no response from a particular group, the router assumes that there are no group members on the network.

The Time-to-Live (TTL) field of query messages is set to 1 so that the queries will not be forwarded to other sub networks.

IGMP version 2 introduces some enhancements such as a method to elect a multicast querier for each LAN, an explicit leave message, and query messages that are specific to a given group.

The states a computer will go through to join or to leave a multicast group are shown below:

Figure 4-8-4: IGMP State Transitions

■ **IGMP Querier –**

A router, or multicast-enabled switch, can periodically ask their hosts if they want to receive multicast traffic. If there is more than one router/switch on the LAN performing IP multicasting, one of these devices is elected “**querier**” and assumes the role of querying the LAN for group members. It then propagates the service requests on to any upstream multicast switch/router to ensure that it will continue to receive the multicast service.

Multicast routers use this information, along with a multicast routing protocol such as DVMRP or PIM, to support IP multicasting across the Internet.

4.8.1 IGMP Setting

This page provides IGMP Snooping related configuration.

Most of the settings are global, whereas the Router Port configuration is related to the current unit, as reflected by the page header. The IGMP Snooping Setting and Information screens in [Figure 4-8-5](#), [Figure 4-8-6](#) and [Figure 4-8-7](#) appear.

| IGMP Snooping | |
|---|---|
| IGMP Snooping Status | <input checked="" type="radio"/> Enable <input type="radio"/> Disable |

| • Last Member Query Interval (sec) | Displays the current last member query interval. |
| • Immediate Leave | Displays the current immediate leave. |

- **Modify**

Click  to edit parameter.

4.8.2 IGMP Querier Setting

This page provides IGMP Querier Setting. The IGMP Querier Setting screens in [Figure 4-8-8](#) and [Figure 4-8-9](#) appear.

IGMP Querier Setting

| VLAN ID | Querier State | Querier Version |
|--------------------------------------|---|--|
| Select VLANs | <input checked="" type="radio"/> Disable <input type="radio"/> Enable | <input checked="" type="radio"/> v2 <input type="radio"/> v3 |
| <input type="button" value="Apply"/> | | |

Figure 4-8-8: IGMP VLAN Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------|---|
| • VLAN ID | Select VLAN ID from this drop-down list. |
| • Querier State | Enable or disable the querier state. The default value is "Disabled". |
| • Querier Version | Sets the querier version for compatibility with other devices on the network. Version: 2 or 3; Default: 2 |

Buttons

: Click to apply changes.

▼ **IGMP Querier Status**

| VLAN ID | Querier State | Querier Status | Querier Version | Querier IP |
|---------|---------------|----------------|-----------------|------------|
| 1 | disabled | Non-Querier | --- | --- |

Figure 4-8-9: IGMP Querier Status Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------|---------------------------------------|
| • VLAN ID | Displays the current VLAN ID. |
| • Querier State | Displays the current querier state. |
| • Querier Status | Displays the current querier status. |
| • Querier Version | Displays the current querier version. |
| • Querier IP | Displays the current querier IP. |

4.8.3 IGMP Static Group

Multicast filtering can be dynamically configured using IGMP Snooping and IGMP Query messages as described in above sections. For certain applications that require tighter control, you may need to statically configure a multicast service on the Industrial Managed Switch. First add all the ports attached to participating hosts to a common VLAN, and then assign the multicast service to that VLAN group.

- Static multicast addresses are never aged out.
- When a multicast address is assigned to an interface in a specific VLAN, the corresponding traffic can only be forwarded to ports within that VLAN.

The IGMP Static Group configuration screens in [Figure 4-8-10](#) and [Figure 4-8-11](#) appear.

| VLAN ID | Group IP Address | Member Ports |
|--|------------------|--------------|
| Select VLANs | | Select Ports |
| <input style="background-color: #0070C0; color: white; border: none; padding: 5px; width: 100px; height: 30px; font-size: 14px; border-radius: 5px;" type="button" value="Add"/> | | |

Figure 4-8-10: Add IGMP Static Group Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------------------|--|
| • VLAN ID | Select VLAN ID for this drop-down list. |
| • Group IP Address | The IP address for a specific multicast service. |
| • Member Ports | Select port number for this drop-down list. |

Buttons

Add : Click to add IGMP router port entry.

| • VLAN ID | Displays the current VLAN ID. |
| • Group IP Address | Displays the current group IP address. |
| • Member Ports | Displays the current member ports. |
| • Modify | Click  to edit parameter. |

4.8.4 IGMP Group Table

This page provides Multicast Database. The IGMP Group Table screen in [Figure 4-8-12](#) appears.

Figure 4-8-12: IGMP Group Table Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------------------|--|
| • VLAN ID | Displays the current VID. |
| • Group IP Address | Displays multicast IP address for a specific multicast service. |
| • Member Port | Displays the current member port. |
| • Type | Member types displayed include Static or Dynamic, depending on selected options. |
| • Life(Sec) | Displays the current life. |

4.8.5 IGMP Router Setting

Depending on your network connections, IGMP snooping may not always be able to locate the IGMP querier. Therefore, if the IGMP querier is a known multicast router/ switch connected over the network to an interface (port or trunk) on your Industrial Managed Switch, you can manually configure the interface (and a specified VLAN) to join all the current multicast groups supported by the attached router. This can ensure that multicast traffic is passed to all the appropriate interfaces within the Industrial Managed Switch.

The IGMP Router Setting and Status screens in [Figure 4-8-13](#) and [Figure 4-8-14](#) appear.

| VLAN ID | Type | Static Ports Select | Forbid Ports Select |
|--|--|---------------------|---------------------|
| Select VLANs | <input checked="" type="radio"/> Static <input type="radio"/> Forbid | Select Static Ports | Select Forbid Ports |
| Add | | | |

Figure 4-8-13: Add Router Port Page Screenshot

The page includes the following fields:

| Object | Description |
|------------------------------|--|
| • VLAN ID | Selects the VLAN to propagate all multicast traffic coming from the attached multicast router. |
| • Type | Sets the Router port type. The types of Router port as below: <ul style="list-style-type: none"> ■ Static ■ Forbid |
| • Static Ports Select | Specify which ports act as router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or IGMP querier. |
| • Forbid Port Select | Specify which ports un-act as router ports. |

| • Modify | Click Edit to edit parameter |

4.9.2 MLD Static Group

The MLD Static Group configuration screens in [Figure 4-9-4](#) and [Figure 4-9-5](#) appear.

Add MLD Static Group

| VLAN ID | Group IP Address | Member Ports |
|--------------|------------------|--------------|
| Select VLANs | :: | Select Ports |

Add

Figure 4-9-4: Add MLD Static Group Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------------------|--|
| • VLAN ID | Select VLAN ID from this drop-down list. |
| • Group IP Address | The IP address for a specific multicast service. |
| • Member Ports | Select port number from this drop-down list. |

Buttons

Add : Click to add IGMP router port entry.

▼ **MLD Static Groups**

| VLAN ID | Group IPv6 Address | Member Ports | Modify |
|---------|--------------------|--------------|--------|
|---------|--------------------|--------------|--------|

Figure 4-9-5: MLD Static Groups Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------------------|--|
| • VLAN ID | Displays the current VLAN ID. |
| • Group IPv6 Address | Displays the current group IPv6 address. |
| • Member Ports | Displays the current member ports. |
| • Modify | Click Edit to edit parameter. |

4.9.3 MLD Group Table

This page provides MLD Group Table. The MLD Group Table screen in [Figure 4-9-6](#) appears.

| MLD Group Table | | | | |
|-----------------|------------------|--------------|------|-----------|
| VLAN ID | Group IP Address | Member Ports | Type | Life(Sec) |
| | | | | |

Figure 4-9-6: MLD Group Table Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------------------|--|
| • VLAN ID | Displays the current VID. |
| • Group IP Address | Displays multicast IP address for a specific multicast service. |
| • Member Port | Displays the current member port. |
| • Type | Member types displayed include Static or Dynamic, depending on selected options. |
| • Life(Sec) | Displays the current life. |

4.9.4 MLD Router Setting

Depending on your network connections, MLD snooping may not always be able to locate the MLD querier. Therefore, if the MLD querier is a known multicast router/ switch connected over the network to an interface (port or trunk) on your Industrial Managed Switch, you can manually configure the interface (and a specified VLAN) to join all the current multicast groups supported by the attached router. This can ensure that multicast traffic is passed to all the appropriate interfaces within the Industrial Managed Switch.

The MLD Router Setting screens in [Figure 4-9-7](#) and [Figure 4-9-8](#) appear.

| Add Router Port | | | |
|------------------------------------|--|---------------------|---------------------|
| VLAN ID | Type | Static Ports Select | Forbid Ports Select |
| Select VLANs | <input checked="" type="radio"/> Static <input type="radio"/> Forbid | Select Static Ports | Select Forbid Ports |
| <input type="button" value="Add"/> | | | |

Figure 4-9-7: Add Router Port Page Screenshot

The page includes the following fields:

| Object | Description |
|------------------------------|---|
| • VLAN ID | Selects the VLAN to propagate all multicast traffic coming from the attached multicast router. |
| • Type | Sets the Router port type. The types of Router port as below: Static Forbid |
| • Static Ports Select | Specify which ports act as router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or MLD querier. |
| • Forbid Port Select | Specify which ports un-act as router ports. |

Buttons

: Click to add MLD router port entry.

| MLD Router Ports Status | | | |
|-------------------------|--------------|-----------------|--------|
| VLAN ID | Static Ports | Forbidden Ports | Modify |
| | | | |

Figure 4-9-8: Router Port Status Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------|---|
| • VLAN ID | Displays the current VLAN ID. |
| • Static Ports | Displays the current static ports. |
| • Forbidden Ports | Displays the current forbidden ports. |
| • Modify | Click  to edit parameter. Click  to delete the group ID entry. |

4.9.5 MLD Router Table

This page provides Router Table. The Dynamic, Static and Forbidden Router Table screens in [Figure 4-9-9](#), [Figure 4-9-10](#) and [Figure 4-9-11](#) appear.

| VLAN ID | Port | Expiry Time (Sec) |
|---------|------|-------------------|
| | | |

Figure 4-9-9: Dynamic Router Table Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------------|--|
| • VLAN ID | Displays the current VLAN ID. |
| • Port | Displays the current dynamic router ports. |
| • Expiry Time (Sec) | Displays the current expiry time. |

| VLAN ID | PortMask |
|---------|----------|
| | |

Figure 4-9-10: Static Router Table Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------|---------------------------------|
| • VLAN ID | Displays the current VLAN ID. |
| • Port Mask | Displays the current port mask. |

| VLAN ID | PortMask |
|---------|----------|

The page includes the following fields:

| Object | Description |
|---------------------|---|
| • Port | Displays the current port. |
| • Filter Profile ID | Displays the current filter profile ID. |
| • Action | Click Show to display detail profile parameter. Click Delete to delete the MLD filter profile entry. |

Refresh

: Click to refresh the MLD Snooping Statistics.

4.10 LLDP

4.10.1 Link Layer Discovery Protocol

Link Layer Discovery Protocol (LLDP) is used to discover basic information about neighboring devices on the local broadcast domain. LLDP is a Layer 2 protocol that uses periodic broadcasts to advertise information about the sending device. Advertised information is represented in **Type Length Value (TLV)** format according to the IEEE 802.1ab standard, and can include details such as device identification, capabilities and configuration settings. LLDP also defines how to store and maintain information gathered about the neighboring network nodes it discovers.

Link Layer Discovery Protocol - Media Endpoint Discovery (LLDP-MED) is an extension of LLDP intended for managing endpoint devices such as Voice over IP phones and network switches. The LLDP-MED TLVs advertise information such as network policy, power, inventory, and device location details. LLDP and LLDP-MED information can be used by SNMP applications to simplify troubleshooting, enhance network management, and maintain an accurate network topology.

4.10.2 LLDP Global Setting

This Page allows the user to inspect and configure the current LLDP port settings. The LLDP Global Setting and Config screens in [Figure 4-10-1](#) and [Figure 4-10-2](#) appear.

| Global Settings | |
|---|---|
| Enabled | <input checked="" type="radio"/> Enabled <input type="radio"/> Disabled |
| LLDP PDU Disable Action | <input type="radio"/> Filtering <input checked="" type="radio"/> Bridging <input checked="" type="radio"/> Flooding |
| Transmission Interval | 30 (5-32768) |
| Holdtime Multiplier | 4 (2-10) |
| Reinitialization Delay | 2 (1-10) |
| Transmit Delay | 2 (1-8192) |
| LLDP-MED Fast Start Repeat Count | 3 (1-10) |
| <input type="button" value="Apply"/> | |

Figure 4-10-1: Global Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------------------|--|
| • Enable | Globally enable or disable LLDP function. |
| • LLDP PDU Disable Action | Set LLDP PDU disable action: include "Filtering", "Bridging" and "Flooding". <ul style="list-style-type: none"> ■ Filtering: discrad all LLDP PDU. ■ Bridging: transmit LLDP PDU in the same VLAN. ■ Flooding: transmit LLDP PDU for all port. |
| • Transmission Interval | The switch is periodically transmitting LLDP frames to its neighbors for having the network discovery information up-to-date. The interval between each LLDP frame is determined by the Transmission Interval value. Valid values are restricted to 5 - 32768 seconds. Default: 30 seconds. This attribute must comply with the following rule: $(\text{Transmission Interval} * \text{Hold Time Multiplier}) \leq 65536, \text{ and } \text{Transmission Interval} \geq (4 * \text{Delay Interval})$ |
| • Holdtime Multiplier | Each LLDP frame contains information about how long the information in the LLDP frame shall be considered valid. The LLDP information valid period is set to Holdtime multiplied by Transmission Interval seconds. Valid values are restricted to 2 - 10 times. TTL in seconds is based on the following rule: |

| | |
|---|--|
| | <p>(Transmission Interval * Holdtime Multiplier) ≤ 65536.</p> <p>Therefore, the default TTL is 4*30 = 120 seconds.</p> |
| • Reinitialization Delay | <p>When a port is disabled, LLDP is disabled or the switch is rebooted a LLDP shutdown frame is transmitted to the neighboring units, signaling that the LLDP information isn't valid anymore. Tx Reinit controls the amount of seconds between the shutdown frame and a new LLDP initialization. Valid values are restricted to 1 - 10 seconds.</p> |
| • Transmit Delay | <p>If some configuration is changed (e.g. the IP address) a new LLDP frame is transmitted, but the time between the LLDP frames will always be at least the value of Transmit Delay seconds. Transmit Delay cannot be larger than 1/4 of the Transmission Interval value. Valid values are restricted to 1 - 8192 seconds.</p> <p>This attribute must comply with the rule:</p> $(4 * Delay Interval) \leq \text{Transmission Interval}$ |
| • LLDP-MED Fast Start Repeat Count | <p>Configures the amount of LLDP MED Fast Start LLDPDUs to transmit during the activation process of the LLDP-MED Fast Start mechanism.</p> <p>Range: 1-10 packets;</p> <p>Default: 3 packets.</p> <p>The MED Fast Start Count parameter is part of the timer which ensures that the LLDP-MED Fast Start mechanism is active for the port. LLDP-MED Fast Start is critical to the timely startup of LLDP, and therefore integral to the rapid availability of Emergency Call Service.</p> |

Buttons

Apply

: Click to apply changes.

The screenshot shows a configuration interface for LLDP Global Config. At the top, there is a header bar with the title "LLDP Global Config". Below the header is a table with two columns: "Config Name" and "Config Value". The table contains the following data:

| Config Name | Config Value |
|----------------------------------|--------------|
| LLDP Enabled | Enabled |
| LLDP PDU Disable Action | Flooding |
| Transmission Interval | 30 Secs |
| Holdtime Multiplier | 4 |
| Reinitialization Delay | 2 Secs |
| Transmit Delay | 2 Secs |
| LLDP-MED Fast Start Repeat Count | 3 PDUs |

Figure 4-10-2: LLDP Global Config Page Screenshot

The page includes the following fields:

| Object | Description |
|---|--|
| • LLDP Enable | Displays the current LLDP status. |
| • LLDP PDU Disable Action | Displays the current LLDP PDU disable action. |
| • Transmission Interval | Displays the current transmission interval. |

4.10.6 MED Network Policy

Network Policy Discovery enables the efficient discovery and diagnosis of mismatch issues with the VLAN configuration, along with the associated Layer 2 and Layer 3 attributes, which apply for a set of specific protocol applications on that port. Improper network policy configurations are a very significant issue in VoIP environments that frequently result in voice quality degradation or loss of service.

Policies are only intended for use with applications that have specific 'real-time' network policy requirements, such as interactive voice and/or video services.

The network policy attributes advertised are:

1. Layer 2 VLAN ID (IEEE 802.1Q-2003)
2. Layer 2 priority value (IEEE 802.1D-2004)
3. Layer 3 Diffserv code point (DSCP) value (IETF RFC 2474)

This network policy is potentially advertised and associated with multiple sets of application types supported on a given port.

The application types specifically addressed are:

1. Voice
2. Guest Voice
3. Softphone Voice
4. Video Conferencing
5. Streaming Video
6. Control / Signaling (conditionally support a separate network policy for the media types above)

A large network may support multiple VoIP policies across the entire organization, and different policies per application type. LLDP-MED allows multiple policies to be advertised per port, each corresponding to a different application type. Different ports on the same Network Connectivity Device may advertise different sets of policies, based on the authenticated user identity or port configuration.

It should be noted that LLDP-MED is not intended to run on links other than between Network Connectivity Devices and Endpoints, and therefore does not need to advertise the multitude of network policies that frequently run on an aggregated link interior to the LAN.

The Voice Auto Mode Configuration, Network Policy Configuration and LLDP MED Network Policy Table screens in [Figure 4-10-10](#) and [Figure 4-10-11](#) appear.

Figure 4-10-10: Voice Auto Mode Configuration and Network Policy Configuration Page Screenshot

The page includes the following fields:

| Object | Description |
|--|---|
| • LLDP MED Policy for Voice Application | Set the LLDP MED policy for voice application mode. |
| • Network Policy Number | Select network policy number for this drop down list. |
| • Application Type | <p>Intended use of the application types:</p> <p>Voice - for use by dedicated IP Telephony handsets and other similar appliances supporting interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security by isolation from data applications.</p> <p>Voice Signaling - for use in network topologies that require a different policy for the voice signaling than for the voice media. This application type should not be advertised if all the same network policies apply as those advertised in the Voice application policy.</p> <p>Guest Voice - support a separate 'limited feature-set' voice service for guest users and visitors with their own IP Telephony handsets and other similar appliances supporting interactive voice services.</p> <p>Guest Voice Signaling - for use in network topologies that require a different policy for the guest voice signaling than for the guest voice media. This application type should not be advertised if all the same network policies apply as those advertised in the Guest Voice application policy.</p> |

| | |
|----------------------|--|
| | <p>Softphone Voice - for use by softphone applications on typical data centric devices, such as PCs or laptops. This class of endpoints frequently does not support multiple VLANs, if at all, and are typically configured to use an 'untagged' VLAN or a single 'tagged' data specific VLAN. When a network policy is defined for use with an 'untagged' VLAN (see Tagged flag below), then the L2 priority field is ignored and only the DSCP value has relevance.</p> <p>Video Conferencing - for use by dedicated Video Conferencing equipment and other similar appliances supporting real-time interactive video/audio services.</p> <p>App Streaming Video - for use by broadcast or multicast based video content distribution and other similar applications supporting streaming video services that require specific network policy treatment. Video applications relying on TCP with buffering would not be an intended use of this application type.</p> <p>Video Signaling - for use in network topologies that require a separate policy for the video signaling than for the video media. This application type should not be advertised if all the same network policies apply as those advertised in the Video Conferencing application policy.</p> |
| • VLAN ID | VLAN identifier (VID) for the port as defined in IEEE 802.1Q-2003. |
| • Tag | <p>Tag indicating whether the specified application type is using a 'tagged' or an 'untagged' VLAN.</p> <p>Untagged indicates that the device is using an untagged frame format and as such does not include a tag header as defined by IEEE 802.1Q-2003. In this case, both the VLAN ID and the Layer 2 priority fields are ignored and only the DSCP value has relevance.</p> <p>Tagged indicates that the device is using the IEEE 802.1Q tagged frame format, and that both the VLAN ID and the Layer 2 priority values are being used, as well as the DSCP value. The tagged format includes an additional field, known as the tag header. The tagged frame format also includes priority tagged frames as defined by IEEE 802.1Q-2003.</p> |
| • L2 Priority | L2 Priority is the Layer 2 priority to be used for the specified application type. L2 Priority may specify one of eight priority levels (0 through 7), as defined by IEEE 802.1D-2004. A value of 0 represents use of the default priority as defined in IEEE 802.1D-2004. |
| • DSCP | DSCP value to be used to provide DiffServ node behavior for the specified application type as defined in IETF RFC 2474. DSCP may contain one of 64 code point values (0 through 63). A value of 0 represents use of the default DSCP value as defined in RFC 2475. |

| GE8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

Figure 4-10-17: LLDP Port Statistics Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------|---|
| • Port | The port on which LLDP frames are received or transmitted. |
| • TX Frame – Total | The number of LLDP frames transmitted on the port. |
| • RX Frame – Total | The number of LLDP frames received on the port. |
| • RX Frame – Discarded | If an LLDP frame is received on a port, and the switch's internal table has run full, the LLDP frame is counted and discarded. This situation is known as "Too Many Neighbors" in the LLDP standard. LLDP frames require a new entry in the table when the Chassis ID or Remote Port ID is not already contained within the table. Entries are removed from the table when a given port links down, an LLDP shutdown frame is received, or when the entry ages out. |
| • RX Frame – Error | The number of received LLDP frames containing some kind of error. |
| • RX TLVs – Discarded | Each LLDP frame can contain multiple pieces of information, known as TLVs (TLV is short for "Type Length Value"). If a TLV is malformed, it is counted and discarded. |
| • RX TLVs – Unrecognized | The number of well-formed TLVs, but with an unknown type value. |
| • RX Ageout - Total | The number of organizationally TLVs received. |

4.11 MAC Address Table

Switching of frames is based upon the DMAC address contained in the frame. The Industrial Managed Switch builds up a table that maps MAC addresses to switch ports for knowing which ports the frames should go to (based upon the DMAC address in the frame). This table contains both static and dynamic entries. The static entries are configured by the network administrator if the administrator wants to do a fixed mapping between the DMAC address and switch ports.

The frames also contain a MAC address (SMAC address), which shows the MAC address of the equipment sending the frame. The SMAC address is used by the switch to automatically update the MAC table with these dynamic MAC addresses. Dynamic entries are removed from the MAC table if no frame with the corresponding SMAC address has been seen after a configurable age time.

4.11.1 Dynamic Learned

Dynamic MAC Table

Dynamic Learned MAC Table is shown on this page. The MAC Table is sorted first by VLAN ID and then by MAC address. The Dynamic Learned screens in [Figure 4-11-1](#) and [Figure 4-11-2](#) appear.

The screenshot shows a search interface for the Dynamic Learned MAC Table. It includes three dropdown menus: Port (set to GE1), VLAN (set to Default), and MAC Address (set to 00:00:00:00:00:00). Below the dropdowns are two buttons: 'View' and 'Clear'.

Figure 4-11-1: Dynamic Learned Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------|--|
| • Port | Select port from this drop-down list. |
| • VLAN | Select VLAN from this drop-down list. |
| • MAC Address | Physical address associated with this interface. |

Buttons

View : Refreshes the displayed table starting from the "Start from MAC address" and "VLAN" input fields

Clear : Flushes all dynamic entries

▼ MAC Address Information

| MAC Address Information | | | | |
|-------------------------|------------|---------|------|---|
| FIRST | PREV | 1 | NEXT | LAST |
| MAC Address | VLAN | Type | Port | |
| 40:61:86:04:18:69 | default(1) | Dynamic | GE1 | Add to Static MAC table |

Total Entries:1

Figure 4-11-2: MAC Address Information Page Screenshot

| Object | Description |
|----------------------|---|
| • MAC Address | The MAC address of the entry. |
| • VLAN | The VLAN ID of the entry. |
| • Type | Indicates whether the entry is a static or dynamic entry. |
| • Port | The ports that are members of the entry. |

Buttons

Add to Static MAC table: Click to add dynamic MAC address to static MAC address.

4.11.2 Dynamic Address Setting

By default, dynamic entries are removed from the MAC table after 300 seconds. The Dynamic Address Setting/Status screens in [Figure 4-11-5](#) and [Figure 4-11-6](#) appear.

Dynamic Address Setting

| | |
|--------------|--|
| Aging Time | <input type="text" value="300"/> (Range: 10 - 630) |
| Apply | |

Figure 4-11-3: Dynamic Addresses Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------------|---|
| • Aging Time | The time after which a learned entry is discarded. Range: 10-630 seconds; Default: 300 seconds . |

Buttons

Apply : Click to apply changes.

▼ Dynamic Address Status

| Information Name | Information Value |
|------------------|-------------------|
| Aging time | 300 |

Figure 4-11-4: Dynamic Addresses Status Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------|----------------------------------|
| • Aging Time | Displays the current aging time. |

4.11.3 Static MAC Setting

The static entries in the MAC table are shown in this table. The MAC table is sorted first by VLAN ID and then by MAC address.

The Static MAC Setting screens in [Figure 4-11-5](#) and [Figure 4-11-6](#) appear.

Static MAC Setting

| MAC Address | VLAN | Port |
|-------------------|-----------|-------|
| 00:00:00:00:00:00 | Default ▾ | GE1 ▾ |

Add

Figure 4-11-5: Statics MAC Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------|--|
| • MAC Address | Physical address associated with this interface. |
| • VLAN | Select VLAN from this drop-down list. |
| • Port | Select port from this drop-down list. |

Buttons

Add : Click to add new static MAC address.

| Static MAC Status | | | | |
|-------------------|-------------------|------------|------|--------|
| No. | MAC Address | VLAN | Port | Delete |
| 1 | A8:F7:E0:20:6A:88 | Default(1) | CPU | |

Figure 4-11-6: Statics MAC Status Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------|--|
| • No. | This is the number for entries. |
| • MAC Address | The MAC address for the entry. |
| • VLAN | The VLAN ID for the entry. |
| • Port | Displays the current port. |
| • Delete | Click Delete to delete static MAC status entry. |

4.11.4 MAC Filtering

By filtering MAC address, the switch can easily filter the per-configured MAC address and reduce the un-safety. The Static MAC Setting screens in [Figure 4-11-7](#) and [Figure 4-11-8](#) appear.

MAC Filtering Setting

| MAC Address | VLAN (1~4094) |
|-------------------|---------------|
| 00:00:00:00:00:00 | 1 |

Add

Figure 4-11-7: MAC Filtering Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------|--|
| • MAC Address | Physical address associated with this interface. |
| • VLAN (1~4096) | Indicates the ID of this particular VLAN. |

Buttons

Add : Click to add new MAC filtering setting.

| Static MAC Status | | | |
|-------------------|-------------|------|--------|
| No. | MAC Address | VLAN | Action |
| | | | |

Figure 4-11-8: Statics MAC Status Page Screenshot

The page includes the following fields:

| Object | Description |
|---------------|--|
| • No. | This is the number for entries. |
| • MAC Address | The MAC address for the entry. |
| • VLAN | The VLAN ID for the entry. |
| • Delete | Click Delete to delete static MAC status entry. |

4.12 Quality of Service

4.12.1 Understanding QoS

Quality of Service (QoS) is an advanced traffic prioritization feature that allows you to establish control over network traffic. QoS enables you to assign various grades of network service to different types of traffic, such as multi-media, video, protocol-specific, time critical, and file-backup traffic.

QoS reduces bandwidth limitations, delay, loss, and jitter. It also provides increased reliability for delivery of your data and allows you to prioritize certain applications across your network. You can define exactly how you want the switch to treat selected applications and types of traffic.

You can use QoS on your system to:

- Control a wide variety of network traffic by:
- Classifying traffic based on packet attributes.
- Assigning priorities to traffic (for example, to set higher priorities to time-critical or business-critical applications).
- Applying security policy through traffic filtering.
- Provide predictable throughput for multimedia applications such as video conferencing or voice over IP by minimizing delay and jitter.
- Improve performance for specific types of traffic and preserve performance as the amount of traffic grows.
- Reduce the need to constantly add bandwidth to the network.
- Manage network congestion.

To implement QoS on your network, you need to carry out the following actions:

1. Define a service level to determine the priority that will be applied to traffic.
2. Apply a classifier to determine how the incoming traffic will be classified and thus treated by the Switch.
3. Create a QoS profile which associates a service level and a classifier.
4. Apply a QoS profile to a port(s).

The **QoS** page of the Industrial Managed Switch contains three types of QoS mode - the **802.1p** mode, **DSCP** mode or **Port-based** mode can be selected. Both the three mode rely on predefined fields within the packet to determine the output queue.

- **802.1p Tag Priority Mode** –The output queue assignment is determined by the IEEE 802.1p VLAN priority tag.
- **IP DSCP Mode** - The output queue assignment is determined by the TOS or DSCP field in the IP packets.
- **Port-Based Priority Mode** – Any packet received from the specify high priority port will treated as a high priority packet.

The Industrial Managed Switch supports **eight priority level** queue, the queue service rate is based on the **WRR(Weight Round Robin)** and **WFQ (Weighted Fair Queuing)** alorithm. The WRR ratio of high-priority and low-priority can be set to “**4:1**” and **8:1**.

4.12.2 General

4.12.2.1 QoS Properties

The QoS Global Setting and Information screen in [Figure 4-12-1](#) and [Figure 4-12-2](#) appear.

| • Rate Limit (Kbps) | Displays the current rate limit. |

4.12.5 Storm Control

Storm control for the switch is configured on this page.

There is an unknown unicast storm rate control, unknown multicast storm rate control, and a broadcast storm rate control.

These only affect flooded frames, i.e. frames with a (VLAN ID, DMAC) pair not present on the MAC Address table.

4.12.5.1 Global Setting

The Storm Control Global Setting and Information screens in [Figure 4-12-23](#) and [Figure 4-12-24](#) appear.

Storm Control Global Setting

| | |
|----------------|--|

| • Unit | Displays the current unit. |
| • Preamble & IFG | Displays the current preamble & IFG. |

4.12.5.2 Port Setting

Storm control for the switch is configured on this page. There are three types of storm rate control:

- **Broadcast** storm rate control
- **Unknown Unicast** storm rate control
- **Unknown Multicast** storm rate control

The configuration indicates the permitted packet rate for unknown unicast, unknown multicast, or broadcast traffic across the switch. The Storm Control Configuration screens in [Figure 4-12-25](#) and [Figure 4-12-26](#) appear.

Storm Control Setting

| Port | Port State | Action | Type Enable | Rate (Kbps) |
|--------------|--|--------|--|-------------|
| Select Ports | <input checked="" type="radio"/> Disable <input type="radio"/> Enable | Drop | <input type="checkbox"/> Broadcast <input type="checkbox"/> Unknown Multicast <input type="checkbox"/> Unknown Unicast | 10000 |
| | | | | 10000 |
| | | | | 10000 |

Apply

Figure 4-12-25: Storm Control Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------|--|
| • Port | Select port from this drop-down list. |
| • Port State | Enable or disable the storm control status for the given storm type. |
| • Action | Configures the action performed when storm control is over rate on a port. Valid values are Shutdown or Drop . |
| • Type Enable | The settings in a particular row apply to the frame type listed here: <ul style="list-style-type: none"> ■ broadcast ■ unknown unicast ■ unknown multicast |
| • Rate (kbps/pps) | Configures the rate for the storm control. The default value is "10,000". |

Buttons

Apply : Click to apply changes

• Storm Control Information

| Port | Port State | Broadcast (Kbps) | Unknown Multicast (Kbps) | Unknown Unicast (Kbps) | Action |

Figure 4-12-26: Storm Control Information Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------------------|--|
| • Port | The switch port number of the logical port. |
| • Port State | Displays the current port state. |
| • Broadcast (Kbps/pps) | Displays the current broadcast storm control rate. |
| • Unknown Multicast (Kbps/pps) | Displays the current unknown multicast storm control rate. |
| • Unknown Unicast (Kbps/pps) | Displays the current unknown unicast storm control rate. |
| • Action | Displays the current action. |

4.12.6 Voice VLAN

4.12.6.1 Introduction to Voice VLAN

Configure the switch port rate limit for the switch port on this page.

Voice VLAN is specially configured for the user voice data traffic. By setting a Voice VLAN and adding the ports of the connected voice equipments to Voice VLAN, the user will be able to configure QoS (Quality of service) service for voice data, and improve voice data traffic transmission priority to ensure the calling quality.

The switch can judge if the data traffic is the voice data traffic from specified equipment according to the source MAC address field of the data packet entering the port. The packet with the source MAC address complying with the system defined voice equipment **OUI (Organizationally Unique Identifier)** will be considered the voice data traffic and transmitted to the Voice VLAN.

The configuration is based on MAC address, acquiring a mechanism in which every voice equipment transmitting information through the network has got its unique MAC address. VLAN will trace the address belongs to specified MAC. By This means, VLAN allows the voice equipment always belong to Voice VLAN when relocated physically. The greatest advantage of the VLAN is the equipment can be automatically placed into Voice VLAN according to its voice traffic which will be transmitted at specified priority. Meanwhile, when voice equipment is physically relocated, it still belongs to the Voice VLAN without any further configuration modification, which is because it is based on voice equipment other than switch port.

Note

The Voice VLAN feature enables the voice traffic to forward on the Voice VLAN, and then the switch can be classified and scheduled to network traffic. **It is recommended there are two VLANs on a port** -- one for voice and one for data.

Note

Before connecting the IP device to the switch, **the IP phone should configure the voice VLAN ID correctly**. It should be configured through its own GUI.

4.12.6.2 Properties

The Voice VLAN feature enables voice traffic to forward on the Voice VLAN, and then the switch can be classified and scheduled to network traffic. It is recommended that there are two VLANs on a port -- one for voice, one for data.

Before connecting the IP device to the switch, the IP phone should configure the voice VLAN ID correctly. It should be configured through its own GUI. This page provides to select the ingress bandwidth preamble. The Ingress Bandwidth Control Setting/Status screen in [Figure 4-12-27](#) and [Figure 4-12-28](#) appears.

| Properties | |
|--------------------------------------|---|
| Voice VLAN State | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| Voice VLAN Id | <input type="text"/> 6 <input type="checkbox"/> Enable |
| Remark CoS/802.1p | <input type="text"/> 6 |
| 1p remark | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled |
| Aging Time(30-65536 min) | <input type="text"/> 1440 |
| <input type="button" value="Apply"/> | |

Figure 4-12-27: Properites Page Screenshot

The page includes the following fields:

| Object | Description |
|------------------------------------|---|
| • Voice VLAN State | Indicates the Voice VLAN mode operation. We must disable MSTP feature before we enable Voice VLAN. It can avoid the conflict of ingress filter. Possible modes are: <input checked="" type="checkbox"/> Enabled : Enable Voice VLAN mode operation. <input type="checkbox"/> Disabled : Disable Voice VLAN mode operation |
| • Voice VLAN ID | Indicates the Voice VLAN ID. It should be a unique VLAN ID in the system and cannot equal each port PVID. It is conflict configuration if the value equal management VID, MVR VID, PVID, etc. The allowed range is 1 to 4095. |
| • Remark CoS/802.1p | Select 802.1p value from this drop-down list. |
| • 1p remark | Enable or disable 802.1p remark. |
| • Aging Time (30-65536 min) | The time after which a port is removed from the Voice VLAN when VoIP traffic is no longer received on the port. (\Default: 1440 minutes). |

Buttons

 : Click to apply changes.

| Voice VLAN State | |
|-------------------|-------------------|
| Information Name | Information Value |
| Voice VLAN State | Disable |
| Voice VLAN ID | None (Disable) |
| Remark CoS/802.1p | 6 |
| 1p Remark State | Disable |
| Aging | 1440 |

4.13.1.2 SSH

Configure SSH on this page. This page shows the Port Security status. Port Security is a module with no direct configuration. Configuration comes indirectly from other modules -- the user modules. When a user module has enabled port security on a port, the port is set up for software-based learning. In this mode, frames from unknown MAC addresses are passed on to the port security module, which in turn asks all user modules whether to allow this new MAC address to forward or block it. For a MAC address to be set in the forwarding state, all enabled user modules must unanimously agree on allowing the MAC address to forward. If only one chooses to block it, it will be blocked until that user module decides otherwise.

The SSH Settings and Information screens in [Figure 4-13-3](#) and [Figure 4-13-4](#) appear.

| SSH Settings | |
|--|---|
| SSH Service | <input type="button" value="Disable"/> |

4.13.3 AAA

Authentication, authorization, and accounting (AAA) provides a framework for configuring access control on the Industrial Managed Switch. The three security functions can be summarized as follows:

- **Authentication** — Identifies users that request access to the network.
- **Authorization** — Determines if users can access specific services.
- **Accounting** — Provides reports, auditing, and billing for services that users have accessed on the network.

The AAA functions require the use of configured RADIUS or TACACS+ servers in the network. The security servers can be defined as sequential groups that are then applied as a method for controlling user access to specified services. For example, when the switch attempts to authenticate a user, a request is sent to the first server in the defined group, if there is no response the second server will be tried, and so on. If at any point a pass or fail is returned, the process stops.

The Industrial Managed Switch supports the following AAA features:

- Accounting for **IEEE 802.1X authenticated users** that access the network through the Industrial Managed Switch.
- Accounting for users that access **management interfaces** on the Industrial Managed Switch through the Telnet.
- Accounting for **commands** that users enter at specific CLI privilege levels. Authorization of users that access management interfaces on the Industrial Managed Switch through the Telnet.

To configure AAA on the Industrial Managed Switch, you need to follow this general process:

1. Configure RADIUS and TACACS+ server access parameters. See “[Configuring Local/Remote Logon Authentication](#)”.
2. Define RADIUS and TACACS+ server groups to support the accounting and authorization of services.
3. Define a method name for each service to which you want to apply accounting or authorization and specify the RADIUS or TACACS+ server groups to use. Apply the method names to port or line interfaces.

This guide assumes that RADIUS and TACACS+ servers have already been configured to support AAA. If the configuration of RADIUS and TACACS+ server software is beyond the scope of this guide, refer to the documentation provided with the RADIUS or TACACS+ server software.

4.13.3.1 Login List

This page is to login list parameters. The authentication list screen in [Figure 4-13-13](#) and [Figure 4-13-14](#) appears.

4.13.4 802.1X

Overview of 802.1X (Port-based) Authentication

In the 802.1X-world, the user is called the supplicant, the switch is the authenticator, and the RADIUS server is the authentication server. The switch acts as the man-in-the-middle, forwarding requests and responses between the supplicant and the authentication server. Frames sent between the supplicant and the switch are special 802.1X frames, known as **EAPOL (EAP over LANs)** frames. EAPOL frames encapsulate **EAP PDUs** (RFC3748). Frames sent between the switch and the RADIUS server are RADIUS packets. RADIUS packets also encapsulate EAP PDUs together with other attributes like the switch's IP address, name, and the supplicant's port number on the switch. EAP is very flexible, in that it allows for different authentication methods, like **MD5-Challenge**, **PEAP**, and **TLS**. The important thing is that the authenticator (the switch) doesn't need to know which authentication method the supplicant and the authentication server are using, or how many information exchange frames are needed for a particular method. The switch simply encapsulates the EAP part of the frame into the relevant type (EAPOL or RADIUS) and forwards it.

When authentication is complete, the RADIUS server sends a special packet containing a success or failure indication. Besides forwarding this decision to the supplicant, the switch uses it to open up or block traffic on the switch port connected to the supplicant.

Overview of User Authentication

It is allowed to configure the Industrial Managed Switch to authenticate users logging into the system for management access using local or remote authentication methods, such as telnet and Web browser. This Industrial Managed Switch provides secure network management access using the following options:

- **Remote Authentication Dial-in User Service (RADIUS)**
- **Terminal Access Controller Access Control System Plus (TACACS+)**
- **Local user name and Privilege Level control**

4.13.4.1 Understanding IEEE 802.1X Port-based Authentication

The IEEE 802.1X standard defines a client-server-based access control and authentication protocol that restricts unauthorized clients from connecting to a LAN through publicly accessible ports. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Until the client is authenticated, 802.1X access control allows only **Extensible Authentication Protocol over LAN (EAPOL)** traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

This section includes this conceptual information:

- Device Roles
- Authentication Initiation and Message Exchange
- Ports in Authorized and Unauthorized States

■ Device Roles

With 802.1X port-based authentication, the devices in the network have specific roles as shown below.

Figure: 802.1X port-based authentication

- **Client**—the device (workstation) that requests access to the LAN and switch services and responds to requests from the switch. The workstation must be running 802.1X-compliant client software such as that offered in the Microsoft Windows XP operating system. (The client is the *supplicant* in the IEEE 802.1X specification.)
- **Authentication server**—performs the actual authentication of the client. The authentication server validates the identity of the client and notifies the switch whether or not the client is authorized to access the LAN and switch services. Because the switch acts as the proxy, the authentication service is transparent to the client. In this release, the Remote Authentication Dial-In User Service (RADIUS) security system with **Extensible Authentication Protocol (EAP)** extensions is the only supported authentication server; it is available in Cisco Secure Access Control Server version 3.0. RADIUS operates in a client/server model in which secure authentication information is exchanged between the RADIUS server and one or more RADIUS clients.
- **Switch (802.1X device)**—controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client. The switch includes the RADIUS client, which is responsible for encapsulating and decapsulating the Extensible Authentication Protocol (EAP) frames and interacting with the authentication server. When the switch receives EAPOL frames and relays them to the authentication server, the Ethernet header is stripped and the remaining EAP frame is re-encapsulated in the RADIUS format. The EAP frames are not modified or examined during encapsulation, and the

authentication server must support EAP within the native frame format. When the switch receives frames from the authentication server, the server's frame header is removed, leaving the EAP frame, which is then encapsulated for Ethernet and sent to the client.

■ Authentication Initiation and Message Exchange

The switch or the client can initiate authentication. If you enable authentication on a port by using the **dot1x port-control auto** interface configuration command, the switch must initiate authentication when it determines that the port link state transitions from down to up. It then sends an EAP-request/identity frame to the client to request its identity (typically, the switch sends an initial identity/request frame followed by one or more requests for authentication information). Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client's identity

If 802.1X is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client transmits frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized.

The specific exchange of EAP frames depends on the authentication method being used. "[Figure EAP Message Exchange](#)" shows a message exchange initiated by the client using the One-Time-Password (OTP) authentication method with a RADIUS server.

Figure: EAP Message Exchange

■ Ports in Authorized and Unauthorized States

The switch port state determines whether or not the client is granted access to the network. The port starts in the *unauthorized* state. While in this state, the port disallows all ingress and egress traffic except for 802.1X protocol packets. When a client is successfully authenticated, the port transitions to the *authorized* state, allowing all traffic for the client to flow normally.

If a client that does not support 802.1X is connected to an unauthorized 802.1X port, the switch requests the client's identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1X-enabled client connects to a port that is not running the 802.1X protocol, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can retransmit the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to transition to the unauthorized state.

If the link state of a port transitions from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

4.13.4.2 802.1X Setting

This page allows you to configure the IEEE 802.1X authentication system.

The IEEE 802.1X standard defines a port-based access control procedure that prevents unauthorized access to a network by requiring users to first submit credentials for authentication. One or more central servers, the backend servers, determine whether the user is allowed access to the network. These backend (RADIUS) servers are configured on the "**Security→802.1X Access Control→802.1X Setting**" page. The IEEE802.1X standard defines port-based operation, but non-standard variants overcome security limitations as shall be explored below.

The 802.1X Setting and Information screens in [Figure 4-13-23](#) and [Figure 4-13-24](#) appear.

4.13.4.4 Guest VLAN Setting

Overview

When a Guest VLAN enabled port's link comes up, the switch starts transmitting EAPOL Request Identity frames. If the number of transmissions of such frames exceeds Max. Reauth. Count and no EAPOL frames have been received in the meantime, the switch considers entering the Guest VLAN. The interval between transmission of EAPOL Request Identity frames is configured with EAPOL Timeout. If Allow Guest VLAN if EAPOL Seen is enabled, the port will now be placed in the Guest VLAN. If disabled, the switch will first check its history to see if an EAPOL frame has previously been received on the port (this history is cleared if the port link goes down or the port's Admin State is changed), and if not, the port will be placed in the Guest VLAN. Otherwise it will not move to the Guest VLAN, but continue transmitting EAPOL Request Identity frames at the rate given by EAPOL Timeout.

Once in the Guest VLAN, the port is considered authenticated, and all attached clients on the port are allowed access on this VLAN. The switch will not transmit an EAPOL Success frame when entering the Guest VLAN.

While in the Guest VLAN, the switch monitors the link for EAPOL frames, and if one such frame is received, the switch immediately takes the port out of the Guest VLAN and starts authenticating the supplicant according to the port mode. If an EAPOL frame is received, the port will never be able to go back into the Guest VLAN if the "Allow Guest VLAN if EAPOL Seen" is disabled.

The 802.1X Guest VLAN setting screens in [Figure 4-13-27](#) and [Figure 4-13-28](#) appear.

Figure 4-13-27: Guest VLAN Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------------------|---|
| • Guest VLAN ID | This is the value that a port's Port VLAN ID is set to if a port is moved into the Guest VLAN. It is only changeable if the Guest VLAN option is globally enabled. Valid values are in the range [1~4094]. |
| • Guest VLAN Enabled | A Guest VLAN is a special VLAN - typically with limited network access - on which 802.1X-unaware clients are placed after a network administrator-defined timeout. The switch follows a set of rules for entering and leaving the Guest VLAN as listed below. The "Guest VLAN Enabled" checkbox provides a quick way to globally |

| • Authentication Method | Displays the current authentication method. |
| • MAC Address | Displays the current MAC address. |

4.13.5 Port Security

This page allows you to configure the Port Security Limit Control system and port settings. Limit Control allows for limiting the number of users on a given port. A user is identified by a MAC address and VLAN ID. If Limit Control is enabled on a port, the limit specifies the maximum number of users on the port. If this number is exceeded, an action is taken. The action can be one of four different as described below.

The Limit Control module is one of the modules that utilize a lower-layer module while the Port Security module manages MAC addresses learned on the port.

The Limit Control configuration consists of two sections, a system- and a port-wid. The IP Source Guard Static Binding Entry and Table Status screens in [Figure 4-13-30](#) and [Figure 4-13-31](#) appear.

| Port Security Settings | | | |
|---|---|--------------|--|
| Port Select | Security | Max L2 Entry | Action |

The page includes the following fields:

| Object | Description |
|----------------|--|
| • Port | Select port from this drop-down list. |
| • Security | Enable or disable the port security. |
| • Mac L2 Entry | <p>The maximum number of MAC addresses that can be secured on this port. If the limit is exceeded, the corresponding action is taken.</p> <p>The switch is "born" with a total number of MAC addresses from which all ports draw whenever a new MAC address is seen on a Port Security-enabled port.</p> <p>Since all ports draw from the same pool, it may happen that a configured maximum cannot be granted, if the remaining ports have already used all available MAC addresses.</p> |
| • Action | <p>If Limit is reached, the switch can take one of the following actions:</p> <ul style="list-style-type: none"> ■ Forward: Do not allow more than Limit MAC addresses on the port, but take no further action. ■ Shutdown: If Limit + 1 MAC addresses is seen on the port, shut down the port. This implies that all secured MAC addresses will be removed from the port, and no new will be learned. Even if the link is physically disconnected and reconnected on the port (by disconnecting the cable), the port will remain shut down. There are three ways to re-open the port: |

1) Disable and re-enable Limit Control on the port or the switch,

2) Click the Reopen button.

- **Discard:** If Limit + 1 MAC addresses is seen on the port, it will trigger the action that do not learn the new MAC and drop the package.
-

4.13.6 DHCP Snooping

4.13.6.1 DHCP Snooping Overview

The addresses assigned to DHCP clients on unsecure ports can be carefully controlled using the dynamic bindings registered with DHCP Snooping. DHCP snooping allows a switch to protect a network from rogue DHCP servers or other devices which send port-related information to a DHCP server. This information can be useful in tracking an IP address back to a physical port.

DHCP Snooping Overview

Command Usage

- Network traffic may be disrupted when malicious DHCP messages are received from an outside source. **DHCP snooping is used to filter DHCP messages received on a non-secure interface from outside the network or firewall.** When DHCP snooping is enabled globally and enabled on a VLAN interface, **DHCP messages received on an untrusted interface from a device not listed in the DHCP snooping table will be dropped.**
- Table entries are only learned for trusted interfaces. An entry is added or removed dynamically to the DHCP snooping table when a client receives or releases an IP address from a DHCP server. Each entry includes a MAC address, IP address, lease time, VLAN identifier, and port identifier.
- When DHCP snooping is enabled, DHCP messages entering an untrusted interface are filtered based upon dynamic entries learned via DHCP snooping.
- Filtering rules are implemented as follows:
 - If the global DHCP snooping is disabled, all DHCP packets are forwarded.

- If DHCP snooping is enabled globally, and also enabled on the VLAN where the DHCP packet is received, all DHCP packets are forwarded for a trusted port. If the received packet is a DHCP ACK message, a dynamic DHCP snooping entry is also added to the binding table.
- If DHCP snooping is enabled globally, and also enabled on the VLAN where the DHCP packet is received, but the port is not trusted, it is processed as follows:
 - If the DHCP packet is a reply packet from a DHCP server (including OFFER, ACK or NAK messages), the packet is dropped.
 - If the DHCP packet is from a client, such as a DECLINE or RELEASE message, the switch forwards the packet only if the corresponding entry is found in the binding table.
 - If the DHCP packet is from a client, such as a DISCOVER, REQUEST, INFORM, DECLINE or RELEASE message, the packet is forwarded if MAC address verification is disabled. However, if MAC address verification is enabled, then the packet will only be forwarded if the client's hardware address stored in the DHCP packet is the same as the source MAC address in the Ethernet header.
 - If the DHCP packet is not a recognizable type, it is dropped.
- If a DHCP packet from a client passes the filtering criteria above, it will only be forwarded to trusted ports in the same VLAN.
- If a DHCP packet is from server is received on a trusted port, it will be forwarded to both trusted and untrusted ports in the same VLAN.
- If the DHCP snooping is globally disabled, all dynamic bindings are removed from the binding table.
- Additional considerations when the switch itself is a DHCP client – The port(s) through which the switch submits a client request to the DHCP server must be configured as trusted. Note that the switch will not add a dynamic entry for itself to the binding table when it receives an ACK message from a DHCP server. Also, when the switch sends out DHCP client packets for itself, no filtering takes place. However, when the switch receives any messages from a DHCP server, any packets received from untrusted ports are dropped.

4.13.6.2 Global Setting

DHCP Snooping is used to block intruder on the untrusted ports of switch when it tries to intervene by injecting a bogus DHCP reply packet to a legitimate conversation between the DHCP client and server. Configure DHCP Snooping on this page. The DHCP Snooping Setting and Information screens in [Figure 4-13-32](#) and [Figure 4-13-33](#) appear.

4.13.6.3 VLAN Setting

Command Usage

- When DHCP snooping is enabled globally on the switch, and enabled on the specified VLAN, DHCP packet filtering will be performed on any untrusted ports within the VLAN.
- When the DHCP snooping is globally disabled, DHCP snooping can still be configured for specific VLANs, but the changes will not take effect until DHCP snooping is globally re-enabled.
- When DHCP snooping is globally enabled, and DHCP snooping is then disabled on a VLAN, all dynamic bindings learned for this VLAN are removed from the binding table.

The DHCP Snooping VLAN Setting screens in [Figure 4-13-34](#) and [Figure 4-13-35](#) appear.

4.13.6.4 Port Setting

Configures switch ports as trusted or untrusted.

Command Usage

- A trusted interface is an interface that is configured to receive only messages from within the network. An untrusted interface is an interface that is configured to receive messages from outside the network or firewall.
- When DHCP snooping enabled both globally and on a VLAN, DHCP packet filtering will be performed on any untrusted ports within the VLAN.
- When an untrusted port is changed to a trusted port, all the dynamic DHCP snooping bindings associated with this port are removed.
- Set all ports connected to DHCP servers within the local network or firewall to trusted state. Set all other ports outside the local network or firewall to untrusted state.

4.13.6.6 Database Agent

Overview of the DHCP Snooping Database Agent

When DHCP snooping is enabled, the switch uses the DHCP snooping binding database to store information about untrusted interfaces. The database can have up to 8192 bindings.

Each database entry (*binding*) has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. A *checksum* value, the end of each entry, is the number of bytes from the start of the file to end of the entry. Each entry is 72 bytes, followed by a space and then the checksum value.

To keep the bindings when the switch reloads, you must use the DHCP snooping database agent. If the agent is disabled, dynamic ARP or IP source guard is enabled, and the DHCP snooping binding database has dynamic bindings, the switch loses its connectivity. If the agent is disabled and only DHCP snooping is enabled, the switch does not lose its connectivity, but DHCP snooping might not prevent DCHP spoofing attacks.

The database agent stores the bindings in a file at a configured location. When reloading, the switch reads the binding file to build the DHCP snooping binding database. The switch keeps the file current by updating it when the database changes.

When a switch learns of new bindings or when it loses bindings, the switch immediately updates the entries in the database. The switch also updates the entries in the binding file. The frequency at which the file is updated is based on a configurable delay, and the updates are batched. If the file is not updated in a specified time (set by the write-delay and abort-timeout values), the update stops.

The DHCP Snooping Database and Information screens in [Figure 4-13-39](#) and [Figure 4-13-40](#) appear.

| • Port | The switch port number of the logical port. |
| • Rate Limit (pps) | Displays the current rate limit. |

4.13.6.8 Option82 Global Setting

DHCP provides a relay mechanism for sending information about the switch and its DHCP clients to DHCP servers. Known as **DHCP Option 82**, it allows compatible DHCP servers to use the information when assigning IP addresses, or to set other services or policies for clients. It is also an effective tool in preventing malicious network attacks from attached clients on DHCP services, such as IP Spoofing, Client Identifier Spoofing, MAC Address Spoofing, and Address Exhaustion.

The **DHCP option 82** enables a DHCP relay agent to insert specific information into a DHCP request packets when forwarding client DHCP packets to a DHCP server and remove the specific information from a DHCP reply packets when forwarding server DHCP packets to a DHCP client. The DHCP server can use this information to implement IP address or other assignment policies. Specifically the option works by setting two sub-options:

- Circuit ID (option 1)
- Remote ID (option2).

The Circuit ID sub-option is supposed to include information specific to which circuit the request came in on.

The Remote ID sub-option was designed to carry information relating to the remote host end of the circuit.

The definition of Circuit ID in the switch is 4 bytes in length and the format is "vlan_id" "module_id" "port_no". The parameter of "vlan_id" is the first two bytes represent the VLAN ID. The parameter of "module_id" is the third byte for the module ID (in standalone switch it always equal 0, in switch it means switch ID). The parameter of "port_no" is the fourth byte and it means the port number.

After enabling DHCP snooping, the switch will monitor all the DHCP messages and implement software transmission. The DHCP Rate Limit Setting and Config screens in [Figure 4-13-43](#) and [Figure 4-13-44](#) appear.

4.13.6.9 Option82 Port Setting

This function is used to set the retransmitting policy of the system for the received DHCP request message which contains option82.

- The **drop** mode means that if the message has option82, then the system will drop it without processing.
- The **keep** mode means that the system will keep the original option82 segment in the message, and forward it to the server to process
- The **replace** mode means that the system will replace the option 82 segment in the existing message with its own option 82, and forward the message to the server to process.

Option82 Port Setting screens in [Figure 4-13-45](#) and [Figure 4-13-46](#) appear.

4.13.7 Dynamic ARP Inspection

Dynamic ARP Inspection (DAI) is a secure feature. Several types of attacks can be launched against a host or devices connected to Layer 2 networks by "poisoning" the ARP caches. This feature is used to block such attacks. Only valid ARP requests and responses can go through DUT. This page provides ARP Inspection related configuration.

A Dynamic ARP prevents the untrusted ARP packets based on the DHCP Snooping Database.

4.13.7.1 Global Setting

4.13.8 IP Source Guard

IP Source Guard is a secure feature used to restrict IP traffic on DHCP snooping untrusted ports by filtering traffic based on the DHCP Snooping Table or manually configured IP Source Bindings. It helps prevent IP spoofing attacks when a host tries to spoof and use the IP address of another host.

After receiving a packet, the port looks up the key attributes (including IP address, MAC address and VLAN tag) of the packet in the binding entries of the IP source guard. If there is a matching entry, the port will forward the packet. Otherwise, the port will abandon the packet.

IP source guard filters packets based on the following types of binding entries:

- IP-port binding entry
- MAC-port binding entry
- IP-MAC-port binding entry

IP Source Guard Overview

4.13.8.1 Port Settings

IP Source Guard is a secure feature used to restrict IP traffic on **DHCP snooping untrusted ports** by filtering traffic based on the DHCP Snooping Table or manually configured IP Source Bindings. It helps prevent IP spoofing attacks when a host tries to spoof and use the IP address of another host.

The IP Source Guard Port Setting and Information screens in [Figure 4-13-58](#) and [Figure 4-13-59](#) appear.

| Port | Status | Verify Source | Max Binding Entry |
|--------------|---|--|-------------------|
| Select Ports | <input type="radio"/> Enabled <input checked="" type="radio"/> Disabled | <input checked="" type="radio"/> IP <input type="radio"/> IP and MAC | No-limited |

Apply

| • Lease Time | Displays the current lease time. |
| • Action | Click Delete to delete IP source guard binding table status entry. |

4.13.9 DoS

The DoS is short for **Denial of Service**, which is a simple but effective destructive attack on the internet. The server under DoS attack will drop normal user data packet due to non-stop processing the attacker's data packet, leading to the denial of the service and worse can lead to leak of sensitive data of the server.

Security feature refers to applications such as protocol check which is for protecting the server from attacks such as DoS. The protocol check allows the user to drop matched packets based on specified conditions. The security features provide several simple and effective protections against Dos attacks while acting no influence on the linear forwarding performance of the switch.

4.13.9.1 DoS Global Setting

The Global DoS Setting and Information screens in [Figure 4-13-62](#) and [Figure 4-13-63](#) appear.

| Global DoS Setting | |

4.13.9.2 DoS Port Setting

The DoS Port Setting and Status screens in [Figure 4-13-64](#) and [Figure 4-13-65](#) appear.

The screenshot shows a configuration page titled "DoS Port Setting". It contains two main sections: "Port Select" and "DoS Protection". The "Port Select" section has a dropdown menu labeled "Select Ports". The "DoS Protection" section contains two radio buttons: "Enable" (selected) and "Disable". Below these sections is a blue "Apply" button.

Figure 4-13-64: DoS Port Setting Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|--|
| • Port Select | Select port from this drop-down list. |
| • DoS Protection | Enable or disable per port DoS protection. |

Buttons

Apply: Click to apply changes.

The screenshot shows a configuration page titled "DoS Port Status". It displays a table with two columns: "Port" and "DoS Protection". The table has four rows for GE ports (GE1, GE2, GE3, GE4) and three rows for LAG ports (LAG6, LAG7, LAG8). All ports are currently set to "Disable".

| Port | DoS Protection |
|------|----------------|
| GE1 | Disable |
| GE2 | Disable |
| GE3 | Disable |
| GE4 | Disable |
| LAG6 | Disable |
| LAG7 | Disable |
| LAG8 | Disable |

Figure 4-13-65: DoS Port Status Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|---|
| • Port | The switch port number of the logical port. |
| • DoS Protection | Displays the current DoS protection. |

4.13.10 ACL

ACL is an acronym for **Access Control List**. It is the list table of ACEs, containing access control entries that specify individual users or groups permitted or denied to specific traffic objects, such as a process or a program. Each accessible traffic object contains an identifier to its ACL. The privileges determine whether there are specific traffic object access rights.

ACL implementations can be quite complex, for example, when the ACEs are prioritized for the various situation. In networking, the ACL refers to a list of service ports or network services that are available on a host or server, each with a list of hosts or servers permitted or denied to use the service. ACL can generally be configured to control inbound traffic, and in this context, they are similar to firewalls.

ACE is an acronym for **Access Control Entry**. It describes access permission associated with a particular ACE ID.

There are three ACE frame types (Ethernet Type, ARP, and IPv4) and two ACE actions (permit and deny). The ACE also contains many detailed, different parameter options that are available for individual application.

The ACL page contains links to the following main topics:

- [**MAC-based ACL**](#) Configuration MAC-based ACL setting
- [**MAC-based ACE**](#) Add / Edit / Delete the MAC-based ACE (Access Control Entry) setting
- [**IPv4-based ACL**](#) Configuration IPv4-based ACL setting
- [**IPv4-based ACE**](#) Add / Edit / Delete the IPv4-based ACE (Access Control Entry) setting
- [**IPv6-based ACL**](#) Configuration IPv6-based ACL setting
- [**IPv6-based ACE**](#) Add / Edit / Delete the IPv6-based ACE (Access Control Entry) setting
- [**ACL Binding**](#) Configure the ACL parameters (ACE) of each switch port.

4.13.10.1 MAC-based ACL

This page shows the ACL status by different ACL users. Each row describes the ACE that is defined. It is a conflict if a specific ACE is not applied to the hardware due to hardware limitations. MAC-based ACL screens in [Figure 4-13-66](#) and [Figure 4-13-67](#) appear.

The screenshot shows a web-based configuration interface for MAC-based ACLs. At the top, a header reads "MAC-Based ACL". Below it is a horizontal input field labeled "ACL Name" with a corresponding empty text box. At the bottom left of the input field is a blue rectangular button labeled "Add".

Figure 4-13-66: MAC-based ACL Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------|------------------------------------|
| • ACL Name | Create a named MAC-based ACL list. |

■ ACL Table

The screenshot shows a web-based configuration interface for an ACL table. At the top, a blue header bar contains a dropdown menu with "ACL Table" selected. Below the header is a horizontal input field labeled "ACL Name" with a corresponding blue rectangular button labeled "Delete" to its right.

Figure 4-13-67: ACL Table Page Screenshot

The page includes the following fields:

| Object | Description |
|-----------------|---|
| • Delete | Click  to delete ACL name entry. |

4.13.10.2 MAC-based ACE

An ACE consists of several parameters. Different parameter options are displayed depending on the frame type that you selected. The MAC-based ACE screens in [Figure 4-13-68](#) and [Figure 4-13-69](#) appear.

| MAC-Based ACE | |
|------------------------------------|---|
| ACL Name | <input type="button" value="▼"/> |
| Sequence | <input type="text"/> (Range: 1 - 2147483647, 1 is first processed) |
| Action | <input checked="" type="radio"/> Permit <input type="radio"/> Deny <input type="radio"/> Shutdown |
| DA MAC | <input checked="" type="radio"/> Any <input type="radio"/> User Defined |
| DA MAC Value | <input type="text"/> |
| DA MAC Mask | <input type="text"/> (0s for matching, 1s for no matching) |
| SA MAC | <input checked="" type="radio"/> Any <input type="radio"/> User Defined |
| SA MAC Value | <input type="text"/> |
| SA MAC Mask | <input type="text"/> (0s for matching, 1s for no matching) |
| VLAN ID | <input type="text"/> (Range: 1 - 4094) |
| 802.1p | <input type="checkbox"/> Include |
| 802.1p Value | <input type="text"/> (Range: 0-7) |
| 802.1p Mask | <input type="text"/> |
| Ethertype(Range:0x05DD-0xFFFF) | <input type="text"/> (Range: 0x05DD-0xFFFF) |
| <input type="button" value="Add"/> | |

Figure 4-13-68: MAC-based ACE Page Screenshot

The page includes the following fields:

| Object | Description |
|------------|--|
| • ACL Name | Select ACL name from this drop-down list. |
| • Sequence | Set the ACL sequence. |
| • Action | Indicates the forwarding action of the ACE. ■ Permit: Frames matching the ACE may be forwarded and learned. ■ Deny: Frames matching the ACE are dropped. ■ Shutdown: Port shutdown is disabled for the ACE. |
| • DA MAC | Specify the destination MAC filter for this ACE. ■ Any: No DA MAC filter is specified. ■ User Defined: If you want to filter a specific destination MAC address with this ACE, choose this value. A field for entering a DA MAC value appears. |

| | |
|--|---|
| • DA MAC Value | When "User Defined" is selected for the DA MAC filter, you can enter a specific destination MAC address. The legal format is "xx-xx-xx-xx-xx-xx". A frame that hits this ACE matches this DA MAC value. |
| • DA MAC Mask | Specify whether frames can hit the action according to their sender hardware address field (SHA) settings. <input checked="" type="checkbox"/> 0: ARP frames where SHA is not equal to the DA MAC address. <input type="checkbox"/> 1: ARP frames where SHA is equal to the DA MAC address. |
| • SA MAC | Specify the source MAC filter for this ACE. <input type="checkbox"/> Any: No SA MAC filter is specified. <input checked="" type="checkbox"/> User Defined: If you want to filter a specific source MAC address with this ACE, choose this value. A field for entering a SA MAC value appears. |
| • SA MAC Value | When "User Defined" is selected for the SA MAC filter, you can enter a specific source MAC address. The legal format is "xx-xx-xx-xx-xx-xx". A frame that hits this ACE matches this SA MAC value. |
| • SA MAC Mask | Specify whether frames can hit the action according to their sender hardware address field (SHA) settings. <input checked="" type="checkbox"/> 0: ARP frames where SHA is not equal to the SA MAC address. <input type="checkbox"/> 1: ARP frames where SHA is equal to the SA MAC address. |
| • VLAN ID | Indicates the ID of this particular VLAN. |
| • 802.1p | Include or exclude the 802.1p value. |
| • 802.1p Value | Set the 802.1p value. |
| • 802.1p Mask | <input checked="" type="checkbox"/> 0: where frame is not equal to the 802.1p value. <input type="checkbox"/> 1: where frame is equal to the 802.1p value. |
| • Ethertype (Range:0x05DD – 0xFFFF) | You can enter a specific EtherType value. The allowed range is 0x05DD to 0xFFFF . A frame that hits this ACE matches this EtherType value. |

4.14 Ring

Use the Maintenance menu items to display and configure basic configurations of The Wall-mount Managed Switch. Under maintenance, the following topics are provided to back up, upgrade, save and restore the configuration. This section has the following items:

- **Ring Wizard** You can quickly build an ERPS ring by wizard.
- **ERPS** You can configure ERPS ring in detail.

ITU-T G.8032 **Ethernet Ring protection switching (ERPS)** is a link layer protocol applied on Ethernet loop protection to provide sub-450ms protection and recovery switching for Ethernet traffic in a ring topology.

ERPS provides a faster redundant recovery than Spanning Tree topology. The action is similar to STP or RSTP, but the algorithms between them are not the same. In the Ring topology, every switch should be enabled with Ring function and two ports should be assigned as the member ports in the ERPS. Only one switch in the Ring group would be set as the RPL owner switch that one port would be blocked, called **owner port**, and PRL neighbor switch has one port that one port would be blocked, called **neighbor port** that connect to owner port directly and this link is called the **Ring Protection Link or RPL**. Each switch will send ETH-CCM message to check the link status in the ring group. When the failure of network connection occurs, the nodes block the failed link and report the signal failure message, the RPL owner switch will automatically unblocks the PRL to recover from the failure.

4.14.1 Ring Wizard

The Ring Wizard instances are configured here; screen in [Figure 4-14-1](#) appears.

Ring Wizard

Note:

1. Please make sure the DHCP client function has been disabled.
2. Please note that the ring port cannot be applied to spanning tree function at the same time.

| | | |

Apply **Reset**

Figure 4-14-3: Ethernet Ring Protocol Switch Configuration page screenshot

PRL Configuration:

| Object | Description |
|-------------------|--|
| • PRL Role | It can be either RPL owner or RPL Neighbor. |
| • PRL Port | This allows to select the east port or west port as the RPL block. |
| • Clear | If the owner has to be changed, then the clear check box allows to clear the RPL owner for that ERPS ring. |

Instance Command:

| Object | Description |
|------------------|---|
| • Command | Administrative command. A port can be administratively configured to be in either manual switch or forced switch state. |
| • Port | Port selection - Port0 or Port1 of the protection Group on which the command is applied. |

ERPS state:

| Object | Description |
|------------------------------|---|
| • Protection State | ERPS state according to State Transition Tables in G.8032. |
| • Port 0 | OK: State of East port is ok SF: State of East port is Signal Fail |
| • Port 1 | OK: State of West port is ok SF: State of West port is Signal Fail |
| • WTR Remaining | Remaining WTR timeout in milliseconds. |
| • RPL Un-blocked | APS is received on the working flow. |
| • Port 0 Block Status | Block status for Port 0 (Both traffic and R-APS block status). R-APS channel is never blocked on sub-rings without virtual channel. |
| • Port 1 Block Status | Block status for Port 1 (Both traffic and R-APS block status). R-APS channel is never blocked on sub-rings without virtual channel. |

4.15 Maintenance

Use the Maintenance menu items to display and configure basic configurations of the Industrial Managed Switch. Under maintenance, the following topics are provided to back up, upgrade, save and restore the configuration. This section has the following items:

- **Factory Default** You can reset the configuration of the switch on this page.
- **Reboot Switch** You can restart the switch on this page. After restart, the switch will boot normally.
- **Backup Manager** You can back up the switch configuration.
- **Upgrade Manager** You can upgrade the switch configuration.
- **Dual Image** Select active or backup image on this page.

4.15.1 Factory Default

You can reset the configuration of the switch on this page. Only the IP configuration is retained. The new configuration is available immediately, which means that no restart is necessary. The Factory Default screen in [Figure 4-15-1](#) appears and clicks to reset the configuration to Factory Defaults.

Figure 4-15-1: Factory Default Page Screenshot

After the “**Factory**” button is pressed and rebooted, the system will load the default IP settings as follows:

- Default IP address: **192.168.0.100**
- Subnet mask: **255.255.255.0**
- Default Gateway: **192.168.0.254**
- The other setting value is back to disable or none.

To reset the Industrial Managed Switch to the Factory default setting, you can also press the hardware reset button on the front panel for about 10 seconds. After the device is rebooted, you can login the management Web interface within the same subnet of 192.168.0.xx.

4.15.2 Reboot Switch

The **Reboot** page enables the device to be rebooted from a remote location. Once the Reboot button is pressed, user has to re-login the Web interface for about 60 seconds. The Reboot Switch screen in [Figure 4-15-2](#) appears and clicks to reboot the system.

Figure 4-15-2: Reboot Switch Page Screenshot

4.15.3 Backup Manager

This function allows backup of the current image or configuration of the Industrial Managed Switch to the local management station. The Backup Manager screen in [Figure 4-15-3](#) appears.

| Backup Manager | |
|---------------------------------------|---|
| Backup Method | TFTP |
| Server IP | (IPv4 or IPv6 Address) |
| Backup Type | <input checked="" type="radio"/> Image <input type="radio"/> Running Configuration <input type="radio"/> Startup Configuration <input type="radio"/> Backup Configuration <input type="radio"/> Flash log <input type="radio"/> Buffered log |
| Image | <input type="radio"/> IGS-4215-16T2S_v1.305b191217.bix (Backup) <input checked="" type="radio"/> IGS-4215-16T2S_v1.305b191219.bix (Active) |
| <input type="button" value="Backup"/> | |

Figure 4-15-3: Backup Manager Page Screenshot

The page includes the following fields:

| Object | Description |
|------------------------|--|
| • Backup Method | Select backup method from this drop-down list. |
| • Server IP | Fill in your TFTP server IP address. |
| • Backup Type | Select backup type. |
| • Image | Select active or backup image. |

Buttons

Backup : Click to back up image, configuration or log.

4.15.4 Upgrade Manager

This function allows reloading of the current image or configuration of the Industrial Managed Switch to the local management station. The Upgrade Manager screen in [Figure 4-15-4](#) appears.

| Upgrade Manager | |
|--|--|
| Upgrade Method | TFTP |
| Server IP | (IPv4 or IPv6 Address) |
| File Name | |
| Upgrade Type | <input checked="" type="radio"/> Image <input type="radio"/> Startup Configuration <input type="radio"/> Backup Configuration <input type="radio"/> Running Configuration |
| Image | <input type="radio"/> (Backup) <input checked="" type="radio"/> (Active) |
| <input type="button" value="Upgrade"/> | |

Figure 4-15-4: Upgrade Manager Page Screenshot

The page includes the following fields:

| Object | Description |
|-------------------------|---|
| • Upgrade Method | Select upgrade method from this drop-down list. |
| • Server IP | Fill in your TFTP server IP address. |
| • File Name | The name of firmware image or configuration. |
| • Upgrade Type | Select upgrade type. |
| • Image | Select active or backup image. |

Buttons

Upgrade : Click to upgrade image or configuration.

4.15.5 Dual Image

This page provides information about the active and backup firmware images in the device, and allows you to revert to the backup image. The web page displays two tables with information about the active and backup firmware images. The Dual Image Configuration and Information screens in [Figure 4-15-5](#) and [Figure 4-15-6](#) appear.

The screenshot shows a configuration interface titled "Dual Image Configuration". It features a table with two rows. The first row has a blue header labeled "Active Image" and contains two radio buttons: one for "IGS-4215-16T2S_v1.305b191217.bix (Backup)" and another checked one for "IGS-4215-16T2S_v1.305b191219.bix (Active)". Below the table is a blue "Apply" button.

Figure 4-15-5: Dual Image Configuration Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------|------------------------------------|
| • Active Image | Select the active or backup image. |

Buttons

The screenshot shows the "Apply" button highlighted in a blue box. A tooltip next to it says: "Click to apply active image."

The screenshot shows a "Images Information" section with two tables. The top table is for the backup image "IGS-4215-16T2S_v1.305b191217.bix" and the bottom table is for the active image "IGS-4215-16T2S_v1.305b191219.bix". Both tables include columns for Image Name, Image Size, and Created Time.

| IGS-4215-16T2S_v1.305b191217.bix | Backup |

| • Image Size | Displays the current image size. |
| • Created Time | Displays the created time. |

4.16 Diagnostics

This section provide the Physical layer and IP layer network diagnostics tools for troubleshoot. The diagnostic tools are designed for network manager to help them quickly diagnose problems between point to point and better service customers.

Use the Diagnostics menu items to display and configure basic administrative details of the Industrial Managed Switch. Under System the following topics are provided to configure and view the system information:

This section has the following items:

- **Cable Diagnostics**
- **Ping Test**
- **IPv6 Ping Test**

4.16.1 Cable Diagnostics

The Cable Diagnostics performs tests on copper cables. These functions have the ability to identify the cable length and operating conditions, and to isolate a variety of common faults that can occur on the Cat5 twisted-pair cabling. There might be two statuses as follow:

- If the link is established on the twisted-pair interface in 1000Base-T mode, the Cable Diagnostics can run without disruption of the link or of any data transfer.
- If the link is established in 100Base-TX or 10Base-T, the Cable Diagnostics cause the link to drop while the diagnostics are running.

After the diagnostics are finished, the link is reestablished. And the following functions are available.

- Coupling between cable pairs.
- Cable pair termination
- Cable Length

Cable Diagnostics is only accurate for cables of length from 15 to 100 meters.

The Copper test and test result screens in [Figure 4-16-1](#) and [Figure 4-16-2](#) appear.

Figure 4-16-1: Copper Test Page Screenshot

The page includes the following fields:

| Object | Description |
|--------|--------------------------------------|
| • Port | Select port from this drop-down list |

Buttons

Copper Test

: Click to run the diagnostics

| Port | Channel A | Cable Length A | Channel B | Cable Length B | Channel C | Cable Length C | Channel D | Cable Length D | Result |
|------|-----------|----------------|-----------|----------------|-----------|----------------|-----------|----------------|--------|
| GE2 | NORMAL | | NORMAL | | NORMAL | | NORMAL | | PASS |

Figure 4-16-2: Test Results Page Screenshot

The page includes the following fields:

| Object | Description |
|--------------------|--|
| • Port | The port where you are requesting Cable Diagnostics. |
| • Channel A~D | Displays the current channel status. |
| • Cable Length A~D | Displays the current cable length. |
| • Result | Displays the test result. |

4.16.2 Ping

The ping and IPv6 ping allow you to issue ICMP PING packets to troubleshoot IP connectivity issues. The Industrial Managed Switch transmits ICMP packets, and the sequence number and roundtrip time are displayed upon reception of a reply.

4.16.2.1 Ping Test

This page allows you to issue ICMP PING packets to troubleshoot IP connectivity issues.

After you press “**Apply**”, ICMP packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs. The ICMP Ping screen in [Figure 4-16-3](#) appears.

| Ping Test Setting | |
|--------------------------------------|---|
| IP Address | <input type="text"/> (x.x.x.x or hostname) |
| Count | <input type="text" value="4"/> (1 - 5 Default : 4) |
| Interval (in sec) | <input type="text" value="1"/> (1 - 5 Default : 1) |
| Size (in bytes) | <input type="text" value="56"/> (8 - 5120 Default : 56) |
| Ping Results | |
| <input type="button" value="Apply"/> | |

Figure 4-16-3: ICMP Ping Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------------|---|
| • IP Address | The destination IP Address. |
| • Count | Number of echo requests to send. |
| • Interval (in sec) | Send interval for each ICMP packet. |
| • Size (in bytes) | The payload size of the ICMP packet. Values range from 8bytes to 5120bytes. |
| • Ping Results | Displays the current ping result. |

Buttons

Apply : Click to transmit ICMP packets.

Be sure the target IP Address is within the same network subnet of the switch, or you have to set up the correct gateway IP address.

4.16.3 IPv6 Ping Test

This page allows you to issue ICMPv6 PING packets to troubleshoot IPv6 connectivity issues.

After you press “**Apply**”, 5 ICMPv6 packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs. The ICMPv6 Ping screen in [Figure 4-16-4](#) appears.

Ping test Setting

| | |
|-------------------|---|
| IPv6 Address | <input type="text"/> (XX:XX:XX:XX) |
| Count | <input type="text" value="4"/> (1 - 5 Default : 4) |
| Interval (in sec) | <input type="text" value="1"/> (1 - 5 Default : 1) |
| Size (in bytes) | <input type="text" value="56"/> (8 - 5120 Default : 56) |
| Ping Results | |

Apply

Figure 4-16-4: ICMPv6 Ping Page Screenshot

The page includes the following fields:

| Object | Description |
|----------------------------|---|
| • IP Address | The destination IPv6 Address. |
| • Count | Number of echo requests to send. |
| • Interval (in sec) | Send interval for each ICMP packet. |
| • Size (in bytes) | The payload size of the ICMP packet. Values range from 8bytes to 5120bytes. |
| • Ping Results | Displays the current ping result. |

Buttons

Apply : Click to transmit ICMPv6 packets

5. SWITCH OPERATION

5.1 Address Table

The Switch is implemented with an address table. This address table is composed of many entries. Each entry is used to store the address information of some nodes on the network, including MAC address, port no, etc. This information comes from the learning process of Ethernet Switch.

5.2 Learning

When one packet comes in from any port, the Switch will record the source address, port number and the other related information in the address table. This information will be used to decide either forwarding or filtering for future packets.

5.3 Forwarding & Filtering

When one packet comes from some port of the Ethernet Switching, it will also check the destination address besides the source address learning. The Ethernet Switching will look up the address table for the destination address. If not found, this packet will be forwarded to all the other ports except the port, which this packet comes in. And these ports will transmit this packet to the network it connected. If found, and the destination address is located at a different port from this packet comes in, the Ethernet Switching will forward this packet to the port where this destination address is located according to the information from the address table. But, if the destination address is located at the same port with this packet, then this packet will be filtered, thereby increasing the network throughput and availability

5.4 Store-and-Forward

Store-and-Forward is one type of packet-forwarding techniques. A Store-and-Forward Ethernet Switching stores the incoming frame in an internal buffer and does the complete error checking before transmission. Therefore, no error packets occur. It is the best choice when a network needs efficiency and stability.

The Ethernet Switch scans the destination address from the packet-header, searches the routing table provided for the incoming port and forwards the packet, only if required. The fast forwarding makes the switch attractive for connecting servers directly to the network, thereby increasing throughput and availability. However, the switch is most commonly used to segment existence hubs, which nearly always improves the overall performance. An Ethernet Switching can be easily configured in any Ethernet network environment to significantly boost bandwidth using the conventional cabling and adapters.

Due to the learning function of the Ethernet switching, the source address and corresponding port number of each incoming and outgoing packet is stored in a routing table. This information is subsequently used to filter packets whose destination address is on the same segment as the source address. This confines network traffic to its respective domain and reduces the overall load on the network.

The Switch performs "Store and forward"; therefore, no error packets occur. More reliably, it reduces the re-transmission rate. No packet loss will occur.

5.5 Auto-Negotiation

The STP ports on the Switch have built-in "**Auto-negotiation**". This technology automatically sets the best possible bandwidth when a connection is established with another network device (usually at Power On or Reset). This is done by detect the modes and speeds at the second of both device is connected and capable of, both 10BASE-T and 100BASE-TX devices can connect with the port in either Half- or Full-Duplex mode. 1000BASE-T can be only connected in Full-duplex mode.

6. TROUBLESHOOTING

This chapter contains information to help you solve issues. If the Industrial Managed Switch is not functioning properly, make sure the Industrial Managed Switch was set up according to instructions in this manual.

■ The Link LED is not lit

Solution:

Check the cable connection and remove duplex mode of the Industrial Managed Switch

■ Some stations cannot talk to other stations located on the other port

Solution:

Please check the VLAN settings, trunk settings, or port enabled/disabled status.

■ Performance is bad

Solution:

Check the full duplex status of the Industrial Managed Switch. If the Industrial Managed Switch is set to full duplex and the partner is set to half duplex, then the performance will be poor. Please also check the in/out rate of the port.

■ Why the Switch doesn't connect to the network

Solution:

1. Check the LNK/ACT LED on the switch
2. Try another port on the Switch
3. Make sure the cable is installed properly
4. Make sure the cable is the right type
5. Turn off the power. After a while, turn on power again

■ 1000BASE-T port link LED is lit, but the traffic is irregular

Solution:

Check that the attached device is not set to dedicate full duplex. Some devices use a physical or software switch to change duplex modes. Auto-negotiation may not recognize this type of full-duplex setting.

■ Switch does not power up

Solution:

1. DC power cable not inserted or faulty
2. Check that the DC power cable is inserted correctly
3. Replace the DC power cable, if the cable is inserted correctly; check that the DC power source is working by connecting a different device in place of the switch.
4. If that device works, refer to the next step.
5. If that device does not work, check the DC power source.

APPENDIX A Switch's RJ45 Pin Assignments

A.1 1000Mbps, 1000BASE-T

| Contact | MDI | MDI-X |
|---------|--------|--------|
| 1 | BI_DA+ | BI_DB+ |
| 2 | BI_DA- | BI_DB- |
| 3 | BI_DB+ | BI_DA+ |
| 4 | BI_DC+ | BI_DD+ |
| 5 | BI_DC- | BI_DD- |
| 6 | BI_DB- | BI_DA- |
| 7 | BI_DD+ | BI_DC+ |
| 8 | BI_DD- | BI_DC- |

Implicit implementation of the crossover function within a twisted-pair cable, or at a wiring panel, while not expressly forbidden, is beyond the scope of this standard.

A.2 10/100Mbps, 10/100BASE-TX

When connecting your 10/100Mbps Ethernet Switch to another switch, a bridge or a hub, a straight or crossover cable is necessary. Each port of the Switch supports auto-MDI/MDI-X detection. That means you can directly connect the Switch to any Ethernet devices without making a crossover cable. The following table and diagram show the standard RJ45 receptacle/connector and their pin assignments:

| RJ45 Connector pin assignment | | |
|-------------------------------|----------------------------------|---|
| Contact | MDI Media Dependent Interface | MDI-X Media Dependent Interface-Cross |
| 1 | Tx + (transmit) | Rx + (receive) |
| 2 | Tx - (transmit) | Rx - (receive) |
| 3 | Rx + (receive) | Tx + (transmit) |
| 4, 5 | Not used | |
| 6 | Rx - (receive) | Tx - (transmit) |
| 7, 8 | Not used | |

The standard cable, RJ45 pin assignment

The standard RJ45 receptacle/connector

There are 8 wires on a standard UTP/STP cable and each wire is color-coded. The following shows the pin allocation and color of straight cable and crossover cable connection:

| Straight-through Cable | | | | | | | | SIDE 1 | SIDE 2 | |
|-------------------------------|---|---|---|---|---|---|---|---------------|--|--|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | SIDE 1 | 1 = White / Orange 2 = Orange 3 = White / Green 4 = Blue 5 = White / Blue 6 = Green 7 = White / Brown 8 = Brown | 1 = White / Orange 2 = Orange 3 = White / Green 4 = Blue 5 = White / Blue 6 = Green 7 = White / Brown 8 = Brown |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | SIDE 2 | 1 = White / Orange 2 = Orange 3 = White / Green 4 = Blue 5 = White / Blue 6 = Green 7 = White / Brown 8 = Brown | 1 = White / Orange 2 = Orange 3 = White / Green 4 = Blue 5 = White / Blue 6 = Green 7 = White / Brown 8 = Brown |
| Crossover Cable | | | | | | | | SIDE 1 | SIDE 2 | |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | SIDE 1 | 1 = White / Orange 2 = Orange 3 = White / Green 4 = Blue 5 = White / Blue 6 = Green 7 = White / Brown 8 = Brown | 1 = White / Green 2 = Green 3 = White / Orange 4 = Blue 5 = White / Blue 6 = Orange 7 = White / Brown 8 = Brown |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | SIDE 2 | 1 = White / Orange 2 = Orange 3 = White / Green 4 = Blue 5 = White / Blue 6 = Green 7 = White / Brown 8 = Brown | 1 = White / Green 2 = Green 3 = White / Orange 4 = Blue 5 = White / Blue 6 = Orange 7 = White / Brown 8 = Brown |

Figure A-1: Straight-through and Crossover Cable

Please make sure your connected cables are with the same pin assignment and color as the above table before deploying the cables into your network.
